Financial Products Markup Language is subject to the Mozilla Public License Version 1.0.

A copy of this license is available at http://www.fpml.org/documents/license.
Status of this Document:

This is the Last Call public Working Draft of FpML 1.0 for review by the public and by members and working groups of the FpML Consortium. It is a draft document and may be updated, replaced or obsoleted by other documents at any time. It is inappropriate to use FpML Working Drafts as reference material or to cite them as other than "work in progress".

It has been reviewed by the FpML Standards Committee which has agreed to its publication as a Last Call draft. The Last Call period is expected to end 25 August, 2000.

The FpML Consortium encourages reviewing organizations and individuals to provide comments as early as possible. Please send comments via e-mail to fpml-issues@egroups.com. Please report each issue in a separate e-mail. An archive of the comments is available together with an issues list.

While implementation experience reports are welcomed, the FpML Consortium will not allow early implementation to constrain its ability to make changes to this specification prior to final release.

This document has been produced by the Products Working Group, with contributions from the Architecture Working Group, as part of the FpML 1.0 Activity and is part of the FpML Standards Approval process. This Activity was initiated by the FpML Steering Committee in November 1999 to produce a limited scope standard covering trade content definitions for interest rate derivatives.

Working Group Members and Acknowledgements:

This specification was produced in the Products Working Group with contributions from the Architecture Working Group. The following members of the Products Working Group contributed to the creation of this document.

Products Working Group

- Takis Mercouris (UBS Warburg), chair
- Andy Aitkenhead (Logica)
- Simon Batty (SunGard Trading and Risk Systems)
- Aline Bouillie (BNP Paribas)
- Jonathan Chapman (Chase Manhattan Bank)
- Eliot Clingman (Concordia Net)
- Marisol Collazo (Fuji Capital Markets Corporation)
- Tim Cropley (IBM)
- Marie-Paule Dumont (S.W.I.F.T.)
- Guy Gurden (J.P. Morgan)
- Peter Lavelle (Morgan Stanley Dean Witter)
- Steven Lord (UBS Warburg)

Products Working Group Alternate (Non-Voting) Members

- Dave Bagge (SunGard Trading and Risk Systems)
- Sylvie Chatelet (BNP Paribas)
• Timothy Gibbs (UBS Warburg)
• Keri Jackson (J.P. Morgan)
• Malene McMahon (S.W.I.F.T.)

Products Working Group Guests

• Andrew Conway (SunGard Trading and Risk Systems)
• Mikael Estvall (Reuters)
• Carlo Palmers (S.W.I.F.T.)

Editor

• Guy Gurden (J.P. Morgan)

1 INTRODUCTION

The Financial Products Markup Language (FpML) is a new protocol enabling e-commerce activities in the field of financial derivatives. The development of the standard, controlled by market participant firms, will ultimately allow the electronic integration of a range of services, from electronic trading and confirmations to portfolio specification for risk analysis. All types of over-the-counter (OTC) derivatives will, over time, be incorporated into the standard, although the initial focus is vanilla interest rate derivatives.

FpML is an application of XML, an internet standard language for describing data shared between computer applications.
2 SCOPE

2.1 Scope

The scope of the Products Working Group is to:

- Complete the definition of the trade content of an interest rate swap supporting the following features:
  - Compounding
  - Averaging
  - Principal Payments (to support cross-currency swaps)
  - Notional Amortization
  - Step-up and Step-down Coupon and Spread Schedules
  - Additional Fees and Payments

- Complete the definition of the trade content of a forward rate agreement (FRA).

Guidelines on precision for rate and currency amount representations within an FpML document are not currently defined in the Working Draft. These have been deferred, pending implementation experience.

Outside the scope of the Products Working Group are the following:

- Definition of business processes that might result in the trade content defined here being transmitted between parties. The definition of these processes and resulting messages is expected to be covered by the work of other FpML Working Groups.

- Definition of reference data related to the counterparty such as settlement instructions, location and contact details. It was agreed that this static data did not belong in each instance of an FpML document and would most likely be stored in central or distributed repositories and referenced from within the document. Specification or design of such repositories is also beyond the scope of the Products Working Group. Since identification of parties is an essential requirement of a trade content definition, the Products Working Group has decided, for this release, to identify parties using the S.W.I.F.T. industry standard bank identifier code (BIC). The FpML Steering and Standards Committees have agreed to look into the subject of static data sources and have created the Counterparty Working Group with this purpose in mind.

2.2 Architecture Framework

The Products Working Group has developed FpML 1.0 within the FpML Architecture defined by the Architecture Working Group. Their recommendations covered:

- XML tools for editing and parsing
- XML namespace usage within FpML 1.0
- FpML versioning methodology
- FpML content model - a new style for representing the FpML Document Type Definition (DTD)
- FpML referencing methodology, including guidelines for referencing coding schemes.
The Products Working Group has submitted the candidate DTD and sample FpML to the Architecture Working Group and has received confirmation that both the DTD and the sample FpML are compliant with the architectural recommendations.

The sample FpML in this specification has been validated in the following XML parsers and tools:

- Microsoft's Internet Explorer 5
- Sun Microsystems' XML Parser 1.0
- Vervet's XML Pro 2.0 (which uses the IBM XML4J Parser)
- Xerces Java Parser 1.0.3 (developed as part of the Apache XML Project).

Extensibility's XML Authority 1.1 schema design tool has been used in the preparation of the DTD and generation of the DTD graphical representations used in this specification.
3 PRODUCT ARCHITECTURE OVERVIEW

3.1 Introduction

FpML incorporates a significant level of structure, rather than being a ‘flat’ representation of data. This structuring is achieved through the grouping of related elements describing particular features of a trade into components. Components can both contain, and be contained by, other components.

An alternative approach would have been to collect all the required elements in a single large component representing a product or trade. A flat structure of this kind would capture all the relevant information concisely but would also constrain the model in two important respects, namely, ease of implementation and extensibility.

Grouping related elements into components makes it easier to validate that the model is correct, that it is complete and that it doesn’t contain redundancy. This is true, both from the perspective of readability to the human eye, and also from the perspective of processing services. Processing services that do not need all the information in a trade definition can isolate components and be sure that the complete set of elements required, and only the elements required, is available for the particular process in hand.

Components additionally serve as the building blocks for a flexible and extensible model. Generally speaking, the complexity of financial products is a result of combining a few simple ideas in a variety of different ways. The component structure supports a trade content definition that is flexible enough to represent the wide variation of features found in traded financial instruments.

It should be noted that the application of the guiding principles of extensibility and ease of use has resulted in a different approach with regard to the forward rate agreement. Because this product is straightforward, commoditized and unlikely to develop further, the advantage to be gained from the extensive use of components is outweighed by the concision of a single component.

3.2 Component Framework

The optimum level of granularity is important to FpML. FpML separates the elements which collectively describe a feature of a product or trade into a separate component with each component serving a particular semantic purpose. Every grouping of elements in FpML is regarded as a component and each component is regarded as a container for the elements that describe that component. In the majority of cases each component will contain a mixture of other components and primitive elements, e.g. a date or string, that collectively describe the features of the component. Components are typically represented in the FpML Document Type Definition (DTD) as XML entities.

Generally speaking, the lower-level a component is, the more re-usable it will be. FpML makes use of a number of primitive entity components that describe the basic building blocks of financial products, for example, FpML_Money, FpML_AdjustableDate, FpML_BusinessCenter, FpML_Interval, FpML_BusinessDayAdjustments etc. These primitive components are re-used in different business contexts.

Primitive components are contained in higher level components that describe the features of particular products. For this reason these higher level components will tend not to be re-usable to the same extent. Examples within the definition of swapStream are the components required to construct schedules of
dates such as calculationPeriodDates, resetDates and paymentDates. However, it should not be inferred from this that any fundamental distinction is drawn between components in usage or structure.

3.3 Overview of Core Trade Components

3.3.1 The Trade Component

The trade is the top-level component within the root element FpML. A trade is an agreement between two parties to enter into a financial contract and the trade component in FpML contains the economic information necessary to execute and confirm that trade. A trade contains four components: tradeHeader, a single product (either swap or fra), party (two or more instances) and otherPartyPayment (zero or more instances).

(See Section 4.1, Interpreting the Diagrams, for an explanation of the graphical DTD representation shown in the following schematics)

- **tradeHeader** - The information within tradeHeader will be common across all types of trade regardless of product. In FpML 1.0 this contains the trade date and party trade identifiers.

- **product** - Product is an abstract concept. The actual component that will appear in FpML 1.0 will be either a swap or an fra component. These contain the economics of the trade and are described in more detail below.

- **party** - The party component holds information about a party involved in the trade. The parties involved will be the principals to the trade and potentially additional third parties such as a broker. For this release, this component is restricted to party identification.

It should be noted that an FpML document is not 'written' from the perspective of one particular party, i.e. it is symmetrical with respect to the principal parties. The particular role that a party plays in the
trade, e.g. buyer, seller, stream payer/receiver, fee payer/receiver, is modeled via the use of references from the component where the role is identified to the party component.

- **otherPartyPayment** – This component contains additional payments such as brokerage paid to third parties which are not part of the economics of a trade itself.

**3.3.2 The Product Component**

The product component specifies the financial instrument being traded. This component captures the economic details of the trade. Because of the complexity of the OTC Interest Rate Derivatives domain that FpML covers, composing these products from various building blocks is a key aspect of the design approach.

FpML 1.0 focuses on the instrument definitions for interest rate swaps (including cross currency swaps) and forward rate agreements. For this initial release, a trade is restricted to containing only a single product. However, in future releases it may be possible to specify more than one financial instrument.

**Interest Rate Swap**

A swap component contains two or more instances of the swapStream component and zero or more instances of the additionalPayment component. A swapStream contains the elements required to define an individual swap leg.

Within FpML there is no concept of a swap header. With the exception of additionalPayment, which can contain fees, it is not possible to define information separately from the swap leg definitions. The additionalPayment component is identical to the otherPartyPayment component shown above.
FpML supports two representations of a swap stream; a parametric representation, and a cashflows representation. The parametric representation is designed to capture all the economic information required regarding dates, amounts and rates to allow trade execution and confirmation. The parametric representation is mandatory. The cashflows representation specifies an optional additional description of the same stream. The cashflows representation is not self contained as it relies on certain information contained within the stream's parametric definition. The elements required from the parametric definition to complete the cashflows representation are:

- The following elements and their sub-elements within the calculationPeriodAmount element:
  - floatingRateIndex
  - indexTenor
  - rateTreatment
  - finalRateRounding
  - averagingMethod
  - dayCountFraction
  - discounting
  - compoundingMethod

- The following elements and their sub-elements within the stubCalculationPeriodAmount element:
  - floatingRateIndex
  - indexTenor.

The inclusion of the cashflows representation is intended to support application integration. For example, a financial institution may have one application that captures trade parameters and constructs the trade schedules and then publishes the result for use by other applications. In this case it may be either undesirable, or impossible, for each of the subscribing applications to store and calculate schedules. The flexibility of the cashflows representation also allows payment and calculation schedules which can not be fully represented by the parametric description. If this situation arises, the mandatory parametric data should still be included in the document and the flag cashflowsMatchParameters should contain the value false to indicate that it is not possible to generate the cashflows from this parametric data.

For FpML documents intended for interchange between parties, if the optional cashflows are included, the flag cashflowsMatchParameters should contain the value true and therefore the parametric and cashflows representation of the stream must be consistent.

Organizations wishing to take advantage, for internal communications, of the facility for specifying cashflows which are inconsistent with the parametric representation will need to specify additional rules for how the parametric representation should be processed. This applies to both the creation of the parametric data as well as its interpretation.

The cashflows representation specifies adjusted dates, that is, dates that have already been adjusted for the relevant business day convention using the relevant set of business day calendars (lists of valid business days for each business center). The FpML standard does not specify the source of these business day calendars. This may lead applications to generate differing cashflow representations from the same parametric representation if they use different business day calendars. The use of adjusted dates also produces schedules that are only valid at a particular instance of time. Additional holidays for a business
center may subsequently be introduced that would result in changes to the adjusted dates, which would not be reflected in the cashflows representation.

In general, an interest rate swap will be a swap with a fixed leg and a floating leg, two floating legs, or two fixed legs. However, certain types of trades may contain more than two legs. FpML 1.0 does not restrict the number of legs that may be defined. From a modeling perspective, FpML does not distinguish between a swap leg referencing a fixed rate and a swap leg referencing a floating rate, the difference being indicated by the existence, for example, of the resetDates component in a floating rate leg.

The structure of a swapStream is shown diagrammatically below:

The components within a swapStream cannot be randomly combined and cannot be thought of as existing in their own right; they only make sense in the given context and in relationship to other components within the swapStream container.

In FpML, the schedule of dates within a swapStream is based around the calculationPeriodDates component. The definition of a calculation period in FpML differs in some respects from the ISDA definition of Calculation Period. In the case of a trade involving compounding, ISDA introduces the concept of a Compounding Period, with several Compounding Periods contributing to a single Calculation Period. The FpML calculation period is equivalent to the ISDA definition of Compounding Period when compounding is applicable, i.e. the calculation period frequency will correspond to the compounding frequency. An FpML calculation period is directly comparable to the ISDA defined Calculation Period when only one calculation period contributes to a payment.

The other date components within swapStream are related to the calculationPeriodDates component. The paymentDates and resetDates components contain the information necessary to construct a schedule of payment and reset dates relative to the calculation period dates.

The information relating to amounts and rates is collected in the calculationPeriodAmount and stubCalculationPeriodAmount components.
Certain `swapStream` components are designated as being optional (although it would be more accurate to say that they are conditional). Thus a fixed rate stream never includes a `resetDates` component, but this is required for a floating rate stream. Similarly, the `stubCalculationPeriodAmount` component will be required if the swap leg has either an initial or final stub, or indeed both, but should otherwise not be specified. The `principalExchanges` component is required in the case of cross currency swaps or other types of swap involving exchanges of principal amounts.

The `payerPartyReference` and `receiverPartyReference` elements indicate which party is paying and which receiving the stream payments. This is done by referencing the appropriate party within the `party` component.

The detailed structures within the `swapStream` are shown diagrammatically below:
Forward Rate Agreement

As noted above, the definition of a forward rate agreement trade is contained within a single component. A forward rate agreement is a simple and commoditized product. This means there is no variation in the product traded and it is not expected to become more complex in the future.

The structure of the fra component is shown diagrammatically below:

![Diagram of fra component]

### 3.4 Coding Schemes

A necessary feature of a portable data standard is both an agreed set of elements and an agreed set of permissible values (the value domain) for those elements. An FpML document exchanged between two parties would not be mutually understandable if either or both of the parties used internal or proprietary coding schemes to populate elements.

Reference data can originate from various sources and the range of permitted values may be more or less extensive. The dayCountFraction is an example of an element with a limited set of permissible values with well-defined meanings. The range of permitted values and their meaning is specified in ISDA and AFB definitions. However, the currency element is an example of where the list of
permitted values is more extensive and the coding scheme reference is to a well-known standard, in this case ISO 4217.

In FpML 1.0 the permitted domain for party identification is a valid bank identifier code (BIC). The BIC is also an ISO standard, ISO 9362. S.W.I.F.T. is the designated registration authority for the assignment of BIC codes.

One possible means of identifying value domains would have been to include the domain of permitted values within the DTD. This solution has been rejected for two reasons. Firstly, in many cases the scope of permitted values is extensive, most obviously with party identifiers, and this would make the standard unnecessarily bulky. Secondly, although there are varying degrees of stability, all value domains are subject to change and including them in the DTD would have necessitated a new version of FpML each time a value domain changed.

For these reasons, FpML uses schemes to identify the permitted values for an element. In each case, the reference scheme will be identified by a URI. The URI will either identify a well-known external standard such as ISO 4217, or where no well-established standard exists, an FpML standard. FpML 1.0 includes provision for a default scheme and the facility to override the default scheme at an element level. In both cases, no values are included for the URI in the DTD in order to avoid coding either particular schemes, or particular versions of schemes, into FpML. For the same reason, the URI quoted in an FpML document for a scheme that is FpML controlled will include a date and version in order to identify the particular version referenced.

It should be noted that the scheme approach adopted by FpML does not allow validation of the values within the DTD. It will be the responsibility of the applications that implement FpML to validate that the contents of an element conform to the specified scheme.

For further details on the architectural framework behind schemes, refer to the FpML Architecture document.
4 COMPONENT DEFINITIONS

4.1 Interpreting the Diagrams

The DTD source shown below is graphically represented in Figure 4.1. Important features of the diagram are highlighted, which include:

- Graphical representation of an XML entity definition
- Sequence indicators, i.e. comma (,) and vertical bar (|)
- Content specifications, i.e. text or sub-elements
- Occurrence indicators, i.e. can appear zero or once (?), can appear one or more times (+), can appear zero or more times (*).

```xml
<!ENTITY % FpML_Root "SubElementA?,SubElementB+">
<!ELEMENT SubElementA (LeafElementA*,(LeafElementB | LeafElementC))>
<!ELEMENT SubElementB (LeafElementA,LeafElementB,LeafElementC,LeafElementD)*)>
<!ELEMENT LeafElementA (#PCDATA)>
<!ELEMENT LeafElementB (#PCDATA)>
<!ELEMENT LeafElementC (#PCDATA)>
<!ELEMENT LeafElementD (#PCDATA)>
```

An XML entity. Note that the entities are shown in the DTD diagrams to emphasize the component nature of FpML and illustrate where re-use is occurring. The entities would not normally appear in a graphical tree structure representation of the FpML DTD in tools such as XML Authority.

These children should be present (depending on their occurrence indicators) in the given sequence, indicated using a comma (,) sequence indicator in the DTD.

Required exactly once

This element has child elements

Optional and if present can occur just once

A choice, indicated using a vertical bar (|) sequence indicator in the DTD

Element has text only

Note that connecting lines are shown to the first and last child elements only

Optional and if present can occur one or more times

Required and can occur one or more times
Figure 4.1: Graphical Representation of a DTD
4.2 Root Element Definition

FpML

Description:
The root element in an FpML trade document.

Figure:

Contents:

trade (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_Trade)

- The FpML trade definition.

DTD Fragment:

<!ELEMENT FpML (trade)>
4.3 **Entity Definitions**

**FpML_AdjustableDate**

*Description:*

An entity for defining a date that shall be subject to adjustment if it would otherwise fall on a day that is not a business day in the specified business centers, together with the convention for adjusting the date.

*Figure:*

```
FpML_AdjustableDate

unadjustedDate

dateAdjustments
```

*Contents:*

**unadjustedDate** (exactly one occurrence; of type *date*)

- A date subject to adjustment.

**dateAdjustments** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity **FpML_BusinessDayAdjustments**)

- The business day convention and financial business centers used for adjusting the date if it would otherwise fall on a day that is not a business day in the specified business centers.

*Used by:*

effectiveDate
firstPeriodStartDate
paymentDate
terminationDate

*DTD Fragment:*

```xml
<!ENTITY % FpML_AdjustableDate "unadjustedDate , dateAdjustments"`
```
FpML_AmountSchedule

Description:
An entity for defining a currency amount or a currency amount schedule. This entity inherits from a base entity, FpML_Schedule.

Figure:

Contents:
inherited element(s)  (this entity inherits the element(s) defined by exactly one occurrence of the entity FpML_Schedule)

• An initial amount or an amount schedule.

currency (exactly one occurrence; of type string, an enumerated domain value defined by currencyScheme)

• The currency in which an amount is denominated.

Used by:
knownAmountSchedule
notionalStepSchedule

DTD Fragment:

<!ENTITY % FpML_AmountSchedule "(%FpML_Schedule; , currency)"
FpML_BusinessCenters

Description:
An entity for defining financial business centers used in determining whether a day is a business day or not.

Figure:

Contents:

**businessCenter** (one or more occurrences; of type string, an enumerated domain value defined by `businessCenterScheme`)

- A code identifying a financial business center location. A list of business centers may be ordered in the document alphabetically based on business center code. An FpML document containing an unordered business center list is still regarded as a conformant document.

Used by:

businessCenters

DTD Fragment:

```xml
<!ENTITY % FpML_BusinessCenters "businessCenter+">`
**FpML_BusinessDayAdjustments**

*Description:*

An entity for defining the business day convention and financial business centers used for adjusting any relevant date if it would otherwise fall on a day that is not a business day in the specified business centers.

*Figure:*

*Contents:*

- **businessDayConvention** (exactly one occurrence; of type *string*, an enumerated domain value defined by *businessDayConventionScheme*)
  - The convention for adjusting a date if it would otherwise fall on a day that is not a business day.

Zero or one occurrence of either

- **businessCentersReference** (exactly one occurrence; an empty element containing an *href* attribute)
  - A pointer style reference to a set of financial business centers defined elsewhere in the document. This set of business centers is used to determine whether a particular day is a business day or not.

  Or

- **businessCenters** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity **FpML_BusinessCenters**)
  - A container for a set of financial business centers. This set of business centers is used to determine whether a day is a business day or not.

*Used by:*

- calculationPeriodDatesAdjustments
- dateAdjustments
- paymentDatesAdjustments
- resetDatesAdjustments

*DTD Fragment:*
<!ENTITY % FpML_BusinessDayAdjustments "businessDayConvention ,
(businessCentersReference | businessCenters)?">
FpML_Calculation

Description:
An entity for defining the parameters used in the calculation of fixed or floating calculation period amounts.

Figure:

Contents:
notionalSchedule (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_Notional)

- The notional amount or notional amount schedule.

Either

fixedRateSchedule (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_Schedule)

- The fixed rate or fixed rate schedule.

Or

floatingRateCalculation (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_FloatingRateCalculation)

- The floating rate calculation definitions.

dayCountFraction (exactly one occurrence; of type string, an enumerated domain value defined by dayCountFractionScheme)

- The day count fraction.

discounting (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_Discounting)
• The parameters specifying any discounting conventions that may apply. This element must only be included if discounting applies.

compoundingMethod (zero or one occurrence; of type string, an enumerated domain value defined by compoundingMethodScheme)

• If more than one calculation period contributes to a single payment amount this element specifies whether compounding is applicable, and if so, what compounding method is to be used. This element must only be included when more than one calculation period contributes to a single payment amount.

Used by:
calculation

DTD Fragment:

<!ENTITY % FpML_Calculation "notionalSchedule , (fixedRateSchedule | floatingRateCalculation) , dayCountFraction , discounting? , compoundingMethod?">
FpML_CalculationPeriod

Description:
An entity for defining the parameters used in the calculation of a fixed or floating rate calculation period amount. This entity forms part of the cashflows representation of a swap stream.

Figure:

Contents:

adjustedStartDate (exactly one occurrence; of type date)
- The calculation period start date, adjusted according to any relevant business day convention.

adjustedEndDate (exactly one occurrence; of type date)
- The calculation period end date, adjusted according to any relevant business day convention.

notionalAmount (exactly one occurrence; of type decimal)
- The calculation period notional amount.

Either

floatingRateDefinition (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_FloatingRateDefinition)
- The floating rate reset information for the calculation period.

Or

fixedRate (exactly one occurrence; of type decimal)
- The calculation period fixed rate. A per annum rate, expressed as a decimal. A fixed rate of 5% would be represented as 0.05.
calculationPeriod

**DTD Fragment:**

`<!ENTITY % FpML_CalculationPeriod "adjustedStartDate, adjustedEndDate, notionalAmount, (floatingRateDefinition | fixedRate)">`
FpML_CalculationPeriodAmount

Description:
An entity for defining the parameters used in the calculation of fixed or floating rate calculation period amounts or for specifying a known calculation period amount or known amount schedule.

Figure:

Contents:
Either

- **calculation** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_Calculation)
  - The parameters used in the calculation of fixed or floating rate calculation period amounts.

Or

- **knownAmountSchedule** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_AmountSchedule)
  - The known calculation period amount or a known amount schedule.

Used by:
calculationPeriodAmount

DTD Fragment:

```xml
<!ENTITY % FpML_CalculationPeriodAmount "calculation | knownAmountSchedule">```
FpML_CalculationPeriodDates

Description:
An entity for defining the parameters used to generate the calculation periods dates schedule, including
the specification of any initial or final stub calculation periods. A calculation periods schedule consists of
an optional initial stub calculation period, one or more regular calculation periods and an optional final
stub calculation period. In the absence of any initial or final stub calculation periods, the regular part of the
calculation period schedule is assumed to be between the effective date and the termination date.

Figure:

Contents:
effectiveDate (exactly one occurrence; contains the sub-element(s) defined by
exactly one occurrence of the entity FpML_AdjustableDate)
  • The first day of the term of the trade. This day may be subject to
    adjustment in accordance with a business day convention.

terminationDate (exactly one occurrence; contains the sub-element(s) defined
by exactly one occurrence of the entity FpML_AdjustableDate)
  • The last day of the term of the trade. This day may be subject to
    adjustment in accordance with a business day convention.

calculationPeriodDatesAdjustments (exactly one occurrence; contains the sub-
element(s) defined by exactly one occurrence of the entity FpML_BusinessDayAdjustments)
  • The business day convention to apply to each calculation period end
    date if it would otherwise fall on a day that is not a business day in
    the specified financial business centers.

firstPeriodStartDate (zero or one occurrence; contains the sub-element(s)
deﬁned by exactly one occurrence of the entity FpML_AdjustableDate)
• The start date of the first calculation period if the date falls before the effective date. It must only be specified if it is not equal to the effective date.

**firstRegularPeriodStartDate** (zero or one occurrence; of type date)

• The start date of the regular part of the calculation period schedule. It must only be specified if there is an initial stub calculation period.

**lastRegularPeriodEndDate** (zero or one occurrence; of type date)

• The end date of the regular part of the calculation period schedule. It must only be specified if there is a final stub calculation period.

**calculationPeriodFrequency** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_CalculationPeriodFrequency`)

• The frequency at which calculation period end dates occur within the regular part of the calculation period schedule and their roll date convention.

*Used by:*

`calculationPeriodDates`

*DTD Fragment:*

```xml
<!ENTITY % FpML_CalculationPeriodDates "effectiveDate , terminationDate ,
calculationPeriodDatesAdjustments , firstPeriodStartDate? ,
firstRegularPeriodStartDate? , lastRegularPeriodEndDate? ,
calculationPeriodFrequency">
```
FpML_CalculationPeriodFrequency

**Description:**

An entity for defining the frequency at which calculation period end dates occur within the regular part of the calculation period schedule and their roll date convention. This entity inherits from a base entity, FpML_Interval.

**Figure:**

![Diagram of FpML_CalculationPeriodFrequency](image)

**Contents:**

- **inherited element(s)** (this entity inherits the element(s) defined by exactly one occurrence of the entity FpML_Interval)
  - The frequency at which calculation period end dates occur within the regular part of the calculation period schedule.

- **rollConvention** (exactly one occurrence; of type string, an enumerated domain value defined by rollConventionScheme)
  - Used in conjunction with a frequency and the regular period start date of a calculation period, determines each calculation period end date within the regular part of a calculation period schedule.

**Used by:**

calculationPeriodFrequency

**DTD Fragment:**

```xml
<!ENTITY % FpML_CalculationPeriodFrequency "%FpML_Interval; ,
          rollConvention">```
FpML_Cashflows

Description:
An entity for defining the cashflow representation of a swap trade.

Figure:

Contents:

cashflowsMatchParameters (exactly one occurrence; of type boolean)

- A true/false flag to indicate whether the cashflows match the parametric definition of the stream, i.e. whether the cashflows could be regenerated from the parameters without loss of information.

principalExchange (zero or more occurrences; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_PrincipalExchange)

- The initial, intermediate and final principal exchange amounts. Typically required on cross currency interest rate swaps where actual exchanges of principal occur. A list of principal exchange elements may be ordered in the document by ascending adjusted principal exchange date. An FpML document containing an unordered principal exchange list is still regarded as a conformant document.

paymentCalculationPeriod (zero or more occurrences; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_PaymentCalculationPeriod)

- The adjusted payment date and associated calculation period parameters required to calculate the actual or projected payment amount. A list of payment calculation period elements may be ordered in the document by ascending adjusted payment date. An FpML document containing an unordered list of payment calculation periods is still regarded as a conformant document.

Used by:
cashflows

DTD Fragment:

<!ENTITY % FpML_Cashflows "cashflowsMatchParameters , principalExchange* , paymentCalculationPeriod*" >
FpML_Discounting

Description:

An entity for defining discounting information. The ISDA 1991 Definitions, Section 9.3-Discounting (related to the calculation of a discounted fixed amount or floating amount) apply. This entity must only be included if discounting applies.

Figure:

Contents:

discountingType (exactly one occurrence; of type string, an enumerated domain value defined by discountingTypeScheme)

- The discounting method that is applicable.

discountRate (zero or one occurrence; of type decimal)

- A discount rate, expressed as a decimal, to be used in the calculation of a discounted amount. A discount rate of 5% would be represented as 0.05.

discountDayCountFraction (zero or one occurrence; of type string, an enumerated domain value defined by dayCountFractionScheme)

- A discount day count fraction to be used in the calculation of a discounted amount.

Used by:

discounting

DTD Fragment:

<!ENTITY % FpML_Discounting "discountingType , discountRate? , discountDayCountFraction?”>
**FpML_Fee**

*Description:*

An entity for defining additional payments associated with a trade which are not defined as part of the stream payments. It may be used to define additional payments between the principal parties involved in the trade or other third parties such as a broker.

*Figure:*

![Diagram of FpML_Fee](image)

*Contents:*

- **payerPartyReference** (exactly one occurrence; an empty element containing an href attribute)
  - A pointer style reference to a party identifier defined elsewhere in the document. The party referenced is the payer of the fee.

- **receiverPartyReference** (exactly one occurrence; an empty element containing an href attribute)
  - A pointer style reference to a party identifier defined elsewhere in the document. The party referenced is the receiver of the fee.

- **paymentType** (zero or one occurrence; of type string, an enumerated domain value defined by paymentTypeScheme)
  - A classification of the type of fee or additional payment, e.g. brokerage, upfront fee etc. FpML does not define domain values for this element.

- **paymentAmount** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity **FpML_Money**)
  - The currency amount of the payment.

- **paymentDate** (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity **FpML_AdjustableDate**)

• The payment date of the fee or additional payment together with any
applicable business day convention and financial business centers for
adjusting the payment date if it would otherwise fall on a day that is
not a valid business day. This element is optional to allow the fee
component to be used to capture commission amounts that might not have
a known payment date associated with them, e.g. commissions may be
invoiced and billed periodically.

adjustedPaymentDate (zero or one occurrence; of type date)

• The adjusted payment date. This element is not intended for use in
trade confirmation but may be specified to allow the fee structure to
also serve as a cashflow type component (all dates in the
FpML_Cashflows entity are adjusted payment dates).

Used by:
additionalPayment
otherPartyPayment

DTD Fragment:

<!ENTITY % FpML_Fee "payerPartyReference , receiverPartyReference ,
paymentType? , PaymentAmount , paymentDate? , adjustedPaymentDate?">
**FpML_FixingDateOffset**

*Description:*

An entity for defining the fixing date relative to each reset date in terms of a business days offset and an associated set of financial business centers.

*Figure:*

![Diagram of FpML_FixingDateOffset]

*Contents:*

- **fixingDaysOffset** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_Offset`)
  - The business days offset from the reset date that the relevant rate for that date is observed. The business day centers that apply are those defined explicitly by the `businessCenters` element or referenced implicitly by the `businessCentersReference` element. The day type associated with the offset must imply a business days offset.

Either

- **businessCentersReference** (exactly one occurrence; an empty element containing an *href* attribute)
  - A pointer style reference to a set of financial business centers defined elsewhere in the document. This set of business centers is used to determine whether a particular day is a business day or not.

Or

- **businessCenters** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_BusinessCenters`)
  - A container for a set of financial business centers. This set of business centers is used to determine whether a day is a business day or not.

*Used by:*

- `fixingDateOffset`
- `fixingDates`

*DTD Fragment:*
<!ENTITY % FpML_FixingDateOffset "fixingDaysOffset ,
(businessCentersReference | businessCenters)>
**FpML_FloatingRate**

*Description:*

An entity for defining the floating rate definitions.

*Figure:*

![Diagram of FpML_FloatingRate]

*Contents:*

- **floatingRateIndex** (exactly one occurrence; of type string, an enumerated domain value defined by floatingRateIndexScheme)
  - The ISDA Floating Rate Option, i.e. the floating rate index.

- **indexTenor** (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_Interval)
  - The ISDA Designated Maturity, i.e. the tenor of the floating rate.

- **spreadSchedule** (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_Schedule)
  - The ISDA Spread or a Spread schedule. The spread is a per annum rate, expressed as a decimal. For purposes of determining a calculation period amount, if positive the spread will be added to the floating rate and if negative the spread will be subtracted from the floating rate. A positive 10 basis point (0.1%) spread would be represented as 0.001.

- **rateTreatment** (zero or one occurrence; of type string, an enumerated domain value defined by rateTreatmentScheme)
  - The specification of any rate conversion which needs to be applied to the observed rate before being used in any calculations. The two common conversions are for securities quoted on a bank discount basis which will need to be converted to either a Money Market Yield or Bond Equivalent Yield. See the 1998 Supplement to the 1991 ISDA Definitions, Section 7.4. General Definitions Relating to Floating Rate Options, paragraphs (e) and (f) for definitions of these terms.
capRateSchedule (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML.Schedule)

- The cap rate or cap rate schedule, if any, which applies to the floating rate. The cap rate is assumed to be exclusive of any spread and is a per annum rate, expressed as a decimal. A cap rate of 5% would be represented as 0.05.

floorRateSchedule (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML.Schedule)

- The floor rate or floor rate schedule, if any, which applies to the floating rate. The floor rate is assumed to be exclusive of any spread and is a per annum rate, expressed as a decimal. A floor rate of 5% would be represented as 0.05.

Used by:

floatingRate

DTD Fragment:

```xml
<!ENTITY % FpML_FloatingRate "floatingRateIndex , indexTenor? , spreadSchedule? , rateTreatment? , capRateSchedule? , floorRateSchedule?"/>
```
FpML_FloatingRateCalculation

Description:
An entity for defining the floating rate definitions and definitions relating to the calculation of floating rate amounts. This entity inherits from a base entity, FpML_FloatingRate.

Figure:

Contents:
inherited element(s) (this entity inherits the element(s) defined by exactly one occurrence of the entity FpML_FloatingRate)

- The floating rate definitions.

initialRate (zero or one occurrence; of type decimal)

- The initial floating rate reset agreed between the principal parties involved in the trade. This is assumed to be the first required reset rate for the first regular calculation period. It should only be included when the rate is not equal to the rate published on the source implied by the floating rate index. An initial rate of 5% would be represented as 0.05.

finalRateRounding (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_Rounding)

- The rounding convention to apply to the final rate used in determination of a calculation period amount.

averagingMethod (zero or one occurrence; of type string, an enumerated domain value defined by averagingMethodScheme)
If averaging is applicable, this element specifies whether a weighted or unweighted average method of calculation is to be used. The element must only be included when averaging applies.

**Used by:**

floatingRateCalculation

**DTD Fragment:**

```xml
<!ENTITY % FpML_FloatingRateCalculation "(%FpML_FloatingRate; , initialRate? , finalRateRounding? , averagingMethod?)">
```
**FpML_FloatingRateDefinition**

*Description:*
An entity defining parameters associated with a floating rate reset. This entity forms part of the cashflows representation of a stream.

*Figure:*

**Contents:**

- **calculatedRate** (zero or one occurrence; of type *decimal*)
  - The final calculated rate for a calculation period after any required averaging of rates. A calculated rate of 5% would be represented as 0.05.

- **rateObservation** (zero or more occurrences; contains the sub-element(s) defined by exactly one occurrence of the entity *FpML_RateObservation*)
  - The details of a particular rate observation, including the fixing date and observed rate. A list of rate observation elements may be ordered in the document by ascending adjusted fixing date. An FpML document containing an unordered list of rate observations is still regarded as a conformant document.

- **spread** (zero or one occurrence; of type *decimal*)
  - The ISDA Spread, if any, which applies for the calculation period. The spread is a per annum rate, expressed as a decimal. For purposes of determining a calculation period amount, if positive the spread will be added to the calculated rate and if negative the spread will be subtracted from the calculated rate. A positive 10 basis point (0.1%) spread would be represented as 0.001.

- **capRate** (zero or one occurrence; of type *decimal*)
  - The cap rate, if any, which applies to the calculated rate for the calculation period. The cap rate is assumed to be exclusive of any spread and is a per annum rate, expressed as a decimal. A cap rate of 5% would be represented as 0.05.

- **floorRate** (exactly one occurrence; of type *decimal*)
• The floor rate, if any, which applies to the calculated rate for the
calculation period. The floor rate is assumed to be exclusive of any
spread and is a per annum rate, expressed as a decimal. A floor rate of
5% would be represented as 0.05.

_Used by:_

floatingRateDefinition

_DTD Fragment:_

```xml
<!ENTITY % FpML_FloatingRateDefinition "calculatedRate? , rateObservation* ,
spread? , capRate? , floorRate?" >
```
**FpML_Fra**

**Description:**
An entity for defining the forward rate agreement (FRA) product.

**Figure:**

![Diagram of FpML_Fra](image)

**Contents:**

- **buyerPartyReference** (exactly one occurrence; an empty element containing an `href` attribute)
  - A pointer style reference to a party identifier defined elsewhere in the document. The party referenced is the buyer of the instrument, also known as the fixed rate payer.

- **sellerPartyReference** (exactly one occurrence; an empty element containing an `href` attribute)
  - A pointer style reference to a party identifier defined elsewhere in the document. The party referenced is the seller of the instrument, also known as the floating rate payer.

- **adjustedEffectiveDate** (exactly one occurrence; of type `date`)
  - 

- The start date of the calculation period. This date should already be adjusted for any applicable business day convention. This is also the date when the observed rate is applied, the reset date.

`adjustedTerminationDate` (exactly one occurrence; of type `date`)

- The end date of the calculation period. This date should already be adjusted for any applicable business day convention.

`paymentDate` (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_AdjustableDate`)

- The payment date. This date is subject to adjustment in accordance with any applicable business day convention.

`fixingDateOffset` (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_FixingDateOffset`)

- Specifies the fixing date as an offset relative to the reset date together with a set of financial business centers used in the date offset calculation.

`dayCountFraction` (exactly one occurrence; of type `string`, an enumerated domain value defined by `dayCountFractionScheme`)

- The day count fraction.

`calculationPeriodNumberOfDays` (exactly one occurrence; of type `positiveInteger`)

- The number of days from the adjusted effective date to the adjusted termination date calculated in accordance with the applicable day count fraction.

`notional` (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_Money`)

- The notional amount.

`fixedRate` (exactly one occurrence; of type `decimal`)

- The fixed rate. A per annum rate, expressed as a decimal. A fixed rate of 5% would be represented as 0.05.

`floatingRateIndex` (exactly one occurrence; of type `string`, an enumerated domain value defined by `floatingRateIndexScheme`)

- The ISDA Floating Rate Option, i.e. the floating rate index.

`indexTenor` (one or more occurrences; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_Interval`)
• The ISDA Designated Maturity, i.e. the tenor of the floating rate. If linear interpolation of two floating rate tenors is applicable then two index tenors must be specified.

fraDiscounting (exactly one occurrence; of type boolean)

• A true/false flag to indicate whether ISDA FRA Discounting applies. If false, then the calculation will be based on a par value and no discounting will apply.

Used by:

fra

DTD Fragment:

```xml
<!ENTITY % FpML_Fra "buyerPartyReference , sellerPartyReference ,

```
FpML 1.0 Last Call Working Draft - 20 June, 2000

FpML_Interval

Description:
An entity for defining a time interval or offset, e.g. one day, three months. Used for specifying frequencies at which events occur, the tenor of a floating rate or an offset relative to another date.

Figure:

Contents:

periodMultiplier (exactly one occurrence; of type integer)

- A time period multiplier, e.g. 1, 2 or 3 etc. A negative value can be used when specifying an offset relative to another date, e.g. -2 days.

period (exactly one occurrence; of type string, an enumerated domain value defined by periodScheme)

- A time period, e.g. a day, week, month or year.

Used by:

FpML_CalculationPeriodFrequency
FpML_Offset
FpML_ResetFrequency
frequency
indexTenor
paymentFrequency
stepFrequency

DTD Fragment:

<!ENTITY % FpML_Interval "periodMultiplier , period"
**FpML_Money**

*Description:*

An entity for defining a currency amount.

*Figure:*

```
<ENTITY % FpML_Money "currency , amount">
```

*Contents:*

- **currency** (exactly one occurrence; of type string, an enumerated domain value defined by `currencyScheme`)
  - The currency in which an amount is denominated.

- **amount** (exactly one occurrence; of type decimal)
  - The monetary quantity in currency units.

*Used by:*

- notional
- paymentAmount
- stubAmount

*DTD Fragment:*

```
<ENTITY % FpML_Money "currency , amount">
```
FpML_Notional

Description:
An entity for defining the notional amount or notional amount schedule associated with a swap stream. The notional schedule will be captured by explicitly specifying the dates that the notional changes and the outstanding notional amount that applies from that date. A parametric representation of the rules defining the notional step schedule can optionally be included.

Figure:

Contents:
notionalStepSchedule (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_AmountSchedule)

- The notional amount or notional amount schedule expressed as explicit outstanding notional amounts and dates.

notionalStepParameters (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_NotionalStepRule)

- A parametric representation of the notional step schedule, i.e. parameters used to generate the notional schedule.

Used by:
notionalSchedule

DTD Fragment:
<!ENTITY % FpML_Notional "notionalStepSchedule , notionalStepParameters?">
**FpML_NotionalStepRule**

*Description:*

An entity for defining a parametric representation of the notional step schedule, i.e. parameters used to generate the notional balance on each step date. The step change in notional can be expressed in terms of either a fixed amount or as a percentage of either the initial notional or previous notional amount. This parametric representation is intended to cover the more common amortizing/accreting.

*Figure:*

![Diagram of FpML_NotionalStepRule](image)

*Contents:*

- **calculationPeriodDatesReference** (exactly one occurrence; an empty element containing an *href* attribute)
  - A pointer style reference to the associated calculation period dates component defined elsewhere in the document.

- **stepFrequency** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity *FpML_Interval*)
  - The frequency at which the step changes occur. This frequency must be a multiple of the stream calculation period frequency.

- **firstNotionalStepDate** (exactly one occurrence; of type *date*)
  - The unadjusted calculation period start date of the first change in notional.

- **lastNotionalStepDate** (exactly one occurrence; of type *date*)
  - The unadjusted calculation period end date of the last change in notional.

Either
**notionalStepAmount** (exactly one occurrence; of type decimal)

- The explicit amount that the notional changes on each step date. This can be a positive or negative amount.

**Or**

**notionalStepRate** (exactly one occurrence; of type decimal)

- The percentage amount by which the notional changes on each step date. The percentage is either a percentage applied to the initial notional amount or the previous outstanding notional, depending on the value of the element stepRelativeTo. The percentage can be either positive or negative. A percentage of 5% would be represented as 0.05.

**stepRelativeTo** (exactly one occurrence; of type string, an enumerated domain value defined by stepRelativeToScheme)

- Specifies whether the notionalStepRate should be applied to the initial notional or the previous notional in order to calculate the notional step change amount.

**Used by:**

notionalStepParameters

**DTD Fragment:**

```xml
<!ENTITY % FpML_NotionalStepRule "calculationPeriodDatesReference , stepFrequency , firstNotionalStepDate , lastNotionalStepDate , (notionalStepAmount | (notionalStepRate , stepRelativeTo))">```
FpML_Offset

Description:
An entity for defining an offset used in calculating a new date relative to a reference date. Currently, the only offsets defined are expected to be expressed as either calendar or business day offsets. This entity inherits from a base entity, FpML_Interval.

Figure:

Contents:

inherited element(s) (this entity inherits the element(s) defined by exactly one occurrence of the entity FpML_Interval)

- The offset specified as a number of days. A negative offset implies counting backwards from the reference date.

dayType (zero or one occurrence; of type string, an enumerated domain value defined by dayTypeScheme)

- In the case of an offset specified as a number of days, this element defines whether consideration is given as to whether a day is a good business day or not. If a day type of business days is specified then non-business days are ignored when calculating the offset. The financial business centers to use for determination of business days are implied by the context in which this element is used. This element must only be included when the offset is specified as a number of days.

Used by:
fixingDaysOffset
paymentDaysOffset
rateCutOffDaysOffset

DTD Fragment:

FpML_Party

Description:
An entity for defining party identifier information.

Figure:

Contents:

partyId (exactly one occurrence; of type string, an enumerated domain value defined by partyIdScheme)

- A party identifier, e.g. a S.W.I.F.T. bank identifier code (BIC).

partyName (zero or one occurrence; of type string)

- The name of the party. A free format string. FpML does not define usage rules for this element.

Used by:

party

DTD Fragment:

<!ENTITY % FpML_Party "partyId , partyName?">
FpML_PartyTradeIdentifier

Description:
An entity for defining one or more trade reference identifiers allocated to the trade by a party. A link identifier allows the trade to be associated with other related trades, e.g. trades forming part of a larger structured transaction. It is expected that for external communication of a trade there will be only one tradeId sent in the document per party.

Figure:

Contents:

partyReference (exactly one occurrence; an empty element containing an href attribute)

- A pointer style reference to a party identifier defined elsewhere in the document. The party referenced has allocated the trade identifier.

tradeId (one or more occurrences; of type string, an enumerated domain value defined by tradeIdScheme)

- A trade reference identifier allocated by a party. FpML does not define the domain values associated with this element. Note that the domain values for this element are not strictly an enumerated list.

linkId (zero or more occurrences; of type string, an enumerated domain value defined by linkIdScheme)

- A link identifier allowing the trade to be associated with other related trades, e.g. the linkId may contain a tradeId for an associated trade or several related trades may be given the same linkId. FpML does not define the domain values associated with this element. Note that the domain values for this element are not strictly an enumerated list.

Used by:

partyTradeIdentifier

DTD Fragment:

<!ENTITY % FpML_PartyTradeIdentifier "partyReference , tradeId+ , linkId*"
FpML_PaymentCalculationPeriod

**Description:**
An entity defining the adjusted payment date and associated calculation period parameters required to calculate the actual or projected payment amount. This entity forms part of the cashflows representation of a swap stream.

**Figure:**

**Contents:**
- **adjustedPaymentDate** (exactly one occurrence; of type date)
  - The adjusted payment date. This date should already be adjusted for any applicable business day convention.

Either
- **calculationPeriod** (one or more occurrences; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_CalculationPeriod)
  - The parameters used in the calculation of a fixed or floating rate calculation period amount. A list of calculation period elements may be ordered in the document by ascending adjusted start date. An FpML document which contains an unordered list of calculation periods is still regarded as a conformant document.

Or
- **fixedPaymentAmount** (exactly one occurrence; of type decimal)
  - A known fixed payment amount.

**Used by:**
paymentCalculationPeriod

**DTD Fragment:**

```xml
<!ENTITY % FpML_PaymentCalculationPeriod "adjustedPaymentDate ,
(calculationPeriod+ | fixedPaymentAmount)">
```
**FpML_PaymentDates**

*Description:*

An entity for defining the parameters used to generate the payment dates schedule, including the specification of early or delayed payments. Payment dates are determined relative to the calculation periods dates or the reset dates.

*Figure:*

![Diagram of FpML_PaymentDates]

**Contents:**

Either

- **calculationPeriodDatesReference** (exactly one occurrence; an empty element containing an href attribute)
  
  - A pointer style reference to the associated calculation period dates component defined elsewhere in the document.

Or

- **resetDatesReference** (exactly one occurrence; an empty element containing an href attribute)
  
  - A pointer style reference to the associated reset dates component defined elsewhere in the document.

- **paymentFrequency** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_Interval)
  
  - The frequency at which regular payment dates occur. If the payment frequency is equal to the frequency defined in the calculation period dates component then one calculation period contributes to each payment amount. If the payment frequency is less frequent than the frequency defined in the calculation period dates component then more than one
calculation period will contribute to each payment amount. A payment frequency more frequent than the calculation period frequency or one that is not a multiple of the calculation period frequency is invalid.

**firstPaymentDate** (zero or one occurrence; of type `date`)

- The first unadjusted payment date. This date may be subject to adjustment in accordance with the specified payment dates adjustments. This element must only be included if there is an initial stub.

**lastRegularPaymentDate** (zero or one occurrence; of type `date`)

- The last regular unadjusted payment date. This date may be subject to adjustment in accordance with the specified payment dates adjustments. This element must only be included if there is a final stub. All calculation periods after this date contribute to the final payment. The final payment is made relative to the final set of calculation periods or the final reset date as the case may be.

**payRelativeTo** (exactly one occurrence; of type `string`, an enumerated domain value defined by `payRelativeToScheme`)

- Specifies whether the payments occur relative to each calculation period start date, calculation period end date or each reset date. The reset date is applicable in the case of certain French Franc floating rate indices. Calculation period start date means relative to the start of the first calculation period contributing to a given payment. Similarly, calculation period end date means the end of the last calculation period contributing to a given payment.

**paymentDaysOffset** (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_Offset`)

- If early payment or delayed payment is required, specifies the number of days offset that the payment occurs relative to what would otherwise be the unadjusted payment date. The offset can be specified in terms of either calendar or business days. Even in the case of a calendar days offset, the resulting payment date, adjusted for the specified calendar days offset, will still be adjusted in accordance with the specified payment dates adjustments.

**paymentDatesAdjustments** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_BusinessDayAdjustments`)

- The business day convention to apply to each payment date if it would otherwise fall on a day that is not a business day in the specified financial business centers.

**Used by:**

paymentDates

**DTD Fragment:**

```xml
<!ENTITY % FpML_PaymentDates "((calculationPeriodDatesReference |)```
resetDatesReference), paymentFrequency, firstPaymentDate?,
lastRegularPaymentDate?, payRelativeTo, paymentDaysOffset?,

FpML_PrincipalExchange

Description:
An entity for defining a principal exchange amount and adjusted exchange date. This entity forms part of the cashflows representation of a swap stream.

Figure:

Contents:
adjustedPrincipalExchangeDate (exactly one occurrence; of type date)

- The principal exchange date. This date should already be adjusted for any applicable business day convention.

principalExchangeAmount (exactly one occurrence; of type decimal)

- The principal exchange amount. This amount should be positive if the stream payer is paying the exchange amount and signed negative if they are receiving it.

Used by:
principalExchange

DTD Fragment:

<!ENTITY % FpML_PrincipalExchange "adjustedPrincipalExchangeDate , principalExchangeAmount">
FpML_PrincipalExchanges

Description:
An entity for defining which principal exchanges occur for the stream.

Figure:

Contents:

initialExchange (exactly one occurrence; of type boolean)
- A true/false flag to indicate whether there is an initial exchange of principal on the effective date.

finalExchange (exactly one occurrence; of type boolean)
- A true/false flag to indicate whether there is a final exchange of principal on the termination date.

intermediateExchange (exactly one occurrence; of type boolean)
- A true/false flag to indicate whether there are intermediate exchanges of principal during the term of the swap.

Used by:
principalExchanges

DTD Fragment:
<!ENTITY % FpML_PrincipalExchanges "initialExchange , finalExchange , intermediateExchange">
**FpML_Product**

*Description:*

An entity defining the available product definitions.

*Figure:*

![Diagram of FpML_Product](image)

*Contents:*

Either

- **swap** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity *FpML_Swap*)
  - A swap product definition.

Or

<tr>
<td><strong>observationWeight</strong> (exactly one occurrence; of type positiveInteger)</td>
</tr>
<tr>
<td>• The number of days weighting to be associated with the rate observation, i.e. the number of days such rate is in effect. This is applicable in the case of a weighted average method of calculation where more than one reset date is established for a single calculation period.</td>
</tr>
<tr>
<td><strong>rateReference</strong> (zero or one occurrence; an empty element containing an href attribute)</td>
</tr>
<tr>
<td>• A pointer style reference to a floating rate component defined as part of a stub calculation period amount component. It is only required when</td>
</tr>
</tbody>
</table>
it is necessary to distinguish two rate observations for the same fixing date which could occur when linear interpolation of two different rates occurs for a stub calculation period.

**Used by:**

rateObservation

**DTD Fragment:**

```
<!ENTITY % FpML_RateObservation "adjustedFixingDate , observedRate?,
treatedRate?, observationWeight , rateReference?">```
**FpML_ResetDates**

**Description:**

An entity for defining the parameters used to generate the reset dates schedule and associated fixing dates. The reset dates are determined relative to the calculation periods schedule dates.

**Figure:**

**Contents:**

- **calculationPeriodDatesReference** (exactly one occurrence; an empty element containing an `href` attribute)
  - A pointer style reference to the associated calculation period dates component defined elsewhere in the document.

- **resetRelativeTo** (zero or one occurrence; of type `string`, an enumerated domain value defined by `resetRelativeToScheme`)
  - Specifies whether the reset dates are determined with respect to each calculation period start date or calculation period end date. If the reset frequency is specified as daily this element must not be included.

- **fixingDates** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_FixingDateOffset`)
  - Specifies the fixing date relative to each reset date in terms of a business days offset and an associated set of financial business centers.

- **rateCutOffDaysOffset** (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_Offset`)
  - Specifies the number of business days before the period end date when the rate cut-off date is assumed to apply. The financial business centers associated with determining the rate cut-off date are those specified in the reset dates adjustments. The rate cut-off number of
days must be a negative integer. The relative rate for each reset date in the period from, and including, a rate cut-off date to, but excluding, the next applicable period end date (or, in the case of the last calculation period, the termination date) will (solely for purposes of calculating the floating amount payable on the next applicable payment date) be deemed to be the relevant rate in effect on that rate cut-off date. For example, if rate cut-off days for a daily averaging deal is -2 business days, then the refix rate applied on (period end date - 2 days) will also be applied as the reset on (period end date - 1 day), i.e. the actual number of reset dates remains the same but from the rate cut-off date until the period end date, the same refix rate is applied. Note that in the case of several calculation periods contributing to a single payment, the rate cut-off is assumed only to apply to the final calculation period contributing to that payment. The day type associated with the offset must imply a business days offset.

resetFrequency (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity **FpML_ResetFrequency**)

- The frequency at which reset dates occur. In the case of a weekly reset frequency, also specifies the day of the week that the reset occurs.

resetDatesAdjustments (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity **FpML_BusinessDayAdjustments**)

- The business day convention to apply to each reset date if it would otherwise fall on a day that is not a business day in the specified financial business centers.

**Used by:**

resetDates

**DTD Fragment:**

```
<!ENTITY % FpML_ResetDates "calculationPeriodDatesReference , resetRelativeTo? , fixingDates , rateCutOffDaysOffset? , resetFrequency , resetDatesAdjustments">
```
**FpML_ResetFrequency**

**Description:**

An entity for defining the reset frequency. In the case of a weekly reset, also specifies the day of the week that the reset occurs. This entity inherits from a base entity, FpML_Interval.

**Figure:**

![Diagram of FpML_ResetFrequency]

**Contents:**

- inherited element(s) (this entity inherits the element(s) defined by exactly one occurrence of the entity FpML_Interval)
  - The frequency at which resets occur.

- weeklyRollConvention (zero or one occurrence; of type string, an enumerated domain value defined by weeklyRollConventionScheme)
  - The day of the week on which a weekly reset date occurs. This element must be included if the reset frequency is defined as weekly and not otherwise.

**Used by:**

resetFrequency

**DTD Fragment:**

```xml
<!ENTITY % FpML_ResetFrequency "(%FpML_Interval; , weeklyRollConvention?)">
```
**FpML_Rounding**

*Description:*

An entity for defining a rounding direction and precision to be used in the rounding of a rate.

*Figure:*

![Diagram of FpML_Rounding](image)

*Contents:*

**roundingDirection** (exactly one occurrence; of type string, an enumerated domain value defined by roundingDirectionScheme)

- Specifies the rounding direction.

**precision** (exactly one occurrence; of type nonNegativeInteger)

- Specifies the rounding precision in terms of a number of decimal places. Note how a percentage rate rounding of 5 decimal places is expressed as a rounding precision of 7 in the FpML document since the percentage is expressed as a decimal, e.g. 9.876543% (or 0.09876543) being rounded to the nearest 5 decimal places is 9.87654% (or 0.0987654).

*Used by:*

finalRateRounding

*DTD Fragment:*

```xml
<!ENTITY % FpML_Rounding "roundingDirection , precision">
```
**FpML_Schedule**

*Description:*

An entity for defining a schedule of rate or amounts in terms of an initial value and then a series of step date and value pairs. On each step date the rate or amount changes to the new step value. The series of step date and value pairs are optional. If not specified, this implies that the initial value remains unchanged over time.

*Figure:*

![Diagram of FpML_Schedule]

*Contents:*

- **initialValue** (exactly one occurrence; of type `decimal`)
  
  - The initial rate or amount, as the case may be. An initial rate of 5% would be represented as 0.05.

- **step** (zero or more occurrences; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_Step`)
  
  - The schedule of step date and value pairs. On each step date the associated step value becomes effective. A list of steps may be ordered in the document by ascending step date. An FpML document containing an unordered list of steps is still regarded as a conformant document.

*Used by:*

- FpML_AmountSchedule
- capRateSchedule
- fixedRateSchedule
- floorRateSchedule
- spreadSchedule

*DTD Fragment:*

```xml
<!ENTITY % FpML_Schedule "initialValue , step*"/>
```
**FpML_Step**

*Description:*

An entity for defining a step date and step value pair. These step definitions are used to define varying rate or amount schedules, e.g. a notional amortization or a step-up coupon schedule.

*Figure:*

![Diagram of FpML_Step with stepDate and stepValue](image)

*Contents:*

- **stepDate** *(exactly one occurrence; of type date)*  
  - The date on which the associated stepValue becomes effective. This date may be subject to adjustment in accordance with a business day convention.

- **stepValue** *(exactly one occurrence; of type decimal)*  
  - The rate or amount which becomes effective on the associated stepDate. A rate of 5% would be represented as 0.05.

*Used by:*

`step`

*DTD Fragment:*

```xml
<!ENTITY % FpML_Step "stepDate , stepValue">```
FpML_Stub

Description:
An entity for defining how a stub calculation period amount is calculated. A single floating rate tenor
different to that used for the regular part of the calculation periods schedule may be specified, or two
floating rate tenors may be specified. If two floating rate tenors are specified then Linear Interpolation (in
accordance with the 1991 ISDA Definitions, Section 9.2. Interpolation) is assumed to apply. Alternatively,
an actual known stub rate or stub amount may be specified.

Figure:

Contents:
Either

floatingRate (one or more occurrences; contains the sub-element(s) defined
by exactly one occurrence of the entity FpML_FloatingRate)

- The rates to be applied to the initial or final stub may be the
  linear interpolation of two different rates. While the majority
  of the time, the rate indices will be the same as that specified
  in the stream and only the tenor itself will be different, it is
  possible to specify two different rates. For example, a 2 month
  stub period may use the linear interpolation of a 1 month and 3
  month rate. The different rates would be specified in this
  component. Note that a maximum of two rates can be specified. If
  a stub period uses the same floating rate index, including tenor,
  as the regular calculation periods then this should not be
  specified again within this component, i.e. the stub calculation
  period amount component may not need to be specified even if
  there is an initial or final stub period. If a stub period uses a
  different floating rate index compared to the regular calculation
  periods then this should be specified within this component. If
  specified here, they are likely to have id attributes, allowing
  them to be referenced from within the cashflows component.

Or

stubRate (exactly one occurrence; of type decimal)

- An actual rate to apply for the initial or final stub period may
  have been agreed between the principal parties (in a similar way
  to how an initial rate may have been agreed for the first regular
  period). If an actual stub rate has been agreed then it would be
  included in this component. It will be a per annum rate,
expressed as a decimal. A stub rate of 5% would be represented as 0.05.

Or

stubAmount (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML Money)

- An actual amount to apply for the initial or final stub period may have been agreed between the two parties. If an actual stub amount has been agreed then it would be included in this component.

Used by:
finalStub
initialStub

DTD Fragment:

<!ENTITY % FpML_Stub "(floatingRate+ | stubRate | stubAmount)">
FpML_StubCalculationPeriodAmount

**Description:**
An entity for defining how the initial or final stub calculation period amounts is calculated. For example, the rate to be applied to the initial or final stub calculation period may be the linear interpolation of two different tenors for the floating rate index specified in the calculation period amount component, e.g. A two month stub period may use the linear interpolation of a one month and three month floating rate. The different rate tenors would be specified in this component. Note that a maximum of two rate tenors can be specified. If a stub period uses a single index tenor and this is the same as that specified in the calculation period amount component then the initial stub or final stub element, as the case may be, must not be included.

**Figure:**

![Diagram of FpML_StubCalculationPeriodAmount](image)

**Contents:**

- **calculationPeriodDatesReference** (exactly one occurrence; an empty element containing an `href` attribute)
  - A pointer style reference to the associated calculation period dates component defined elsewhere in the document.

- **initialStub** (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML Stub)
  - Specifies how the initial stub amount is calculated. A single floating rate tenor different to that used for the regular part of the calculation periods schedule may be specified, or two floating tenors may be specified. If two floating rate tenors are specified then Linear Interpolation (in accordance with the ISDA definitions) is assumed to apply. Alternatively, an actual known stub rate or stub amount may be specified.

- **finalStub** (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML Stub)
  - Specifies how the final stub amount is calculated. A single floating rate tenor different to that used for the regular part of the calculation periods schedule may be specified, or two floating tenors may be specified. If two floating rate tenors are specified then Linear Interpolation (in accordance with the ISDA definitions) is assumed to apply. Alternatively, an actual known stub rate or stub amount may be specified.

**Used by:**

FpML_Swap

Description:
An entity for defining swap streams and additional payments between the principal parties involved in the swap.

Figure:

Contents:

- **swapStream** (one or more occurrences; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_SwapStream`)
  - The swap streams.

- **additionalPayment** (zero or more occurrences; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_Fee`)
  - Additional payments between the principal parties involved in the swap.

Used by:

- swap

DTD Fragment:

```
<!ENTITY % FpML_Swap "swapStream+ , additionalPayment*">```
FpML_SwapStream

Description:
An entity for defining the components specifying a swap stream, including both a parametric and cashflows representation of a swap stream.

Figure:

Contents:
payerPartyReference (exactly one occurrence; an empty element containing an href attribute)
- A pointer style reference to a party identifier defined elsewhere in the document. The party referenced is the payer of stream payments.

receiverPartyReference (exactly one occurrence; an empty element containing an href attribute)
- A pointer style reference to a party identifier defined elsewhere in the document. The party referenced is the receiver of stream payments.

calculationPeriodDates (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_CalculationPeriodDates)
- The calculation periods dates schedule.

paymentDates (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity FpML_PaymentDates)
- The payment dates schedule.
**resetDates** (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_ResetDates`)

- The reset dates schedule. The reset dates schedule only applies for a floating rate stream.

**calculationPeriodAmount** (exactly one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_CalculationPeriodAmount`)

- The calculation period amount parameters.

**stubCalculationPeriodAmount** (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_StubCalculationPeriodAmount`)

- The stub calculation period amount parameters. This element must only be included if there is an initial or final stub calculation period. Even then, it must only be included if either the stub references a different floating rate tenor to the regular calculation periods, or if the stub is calculated as a linear interpolation of two different floating rate tenors, or if a specific stub rate or stub amount has been negotiated.

**principalExchanges** (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_PrincipalExchanges`)

- The true/false flags indicating whether initial, intermediate or final exchanges of principal should occur.

**cashflows** (zero or one occurrence; contains the sub-element(s) defined by exactly one occurrence of the entity `FpML_Cashflows`)

- The cashflows representation of the swap stream.

**Used by:**

swapStream

**DTD Fragment:**

```xml
<!ENTITY % FpML_SwapStream "payerPartyReference , receiverPartyReference ,

### 6 DATA DICTIONARY

#### 6.1 Element Definitions

<table>
<thead>
<tr>
<th>Element &amp; Type / Description</th>
<th>Used By Entity</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>additionalPayment</strong> ; entity type: FpML_Fee</td>
<td>FpML_Swap</td>
</tr>
<tr>
<td>Additional payments between the principal parties involved in the swap.</td>
<td></td>
</tr>
<tr>
<td><strong>adjustedEffectiveDate</strong> ; built-in datatype: date</td>
<td>FpML_Fra</td>
</tr>
<tr>
<td>The start date of the calculation period. This date should already be adjusted for any applicable business day convention. This is also the date when the observed rate is applied, the reset date.</td>
<td></td>
</tr>
<tr>
<td><strong>adjustedEndDate</strong> ; built-in datatype: date</td>
<td>FpML_CalculationPeriod</td>
</tr>
<tr>
<td>The calculation period end date, adjusted according to any relevant business day convention.</td>
<td></td>
</tr>
<tr>
<td><strong>adjustedFixingDate</strong> ; built-in datatype: date</td>
<td>FpML_RateObservation</td>
</tr>
<tr>
<td>The adjusted fixing date, i.e. the actual date the rate is observed. This date should already be adjusted for any applicable business day convention.</td>
<td></td>
</tr>
<tr>
<td><strong>adjustedPaymentDate</strong> ; built-in datatype: date</td>
<td>FpML_Fee FpML_PaymentCalculationPeriod</td>
</tr>
<tr>
<td>The adjusted payment date. This date should already be adjusted for any applicable business day convention. (FpML_Fee Usage) This element is not intended for use in trade confirmation but may be specified to allow the fee structure to also serve as a cashflow type component (all dates in the FpML_Cashflows entity are adjusted payment dates).</td>
<td></td>
</tr>
<tr>
<td>Element Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>adjustedPrincipalExchangeDate</code></td>
<td>The principal exchange date. This date should already be adjusted for any applicable business day convention.</td>
</tr>
<tr>
<td><code>adjustedStartDate</code></td>
<td>The calculation period start date, adjusted according to any relevant business day convention.</td>
</tr>
<tr>
<td><code>AdjustedTerminationDate</code></td>
<td>The end date of the calculation period. This date should already be adjusted for any applicable business day convention.</td>
</tr>
<tr>
<td><code>amount</code></td>
<td>The monetary quantity in currency units.</td>
</tr>
<tr>
<td><code>averagingMethod</code></td>
<td>If averaging is applicable, this element specifies whether a weighted or unweighted average method of calculation is to be used. The element must only be included when averaging applies.</td>
</tr>
<tr>
<td><code>businessCenter</code></td>
<td>A code identifying a financial business center location. A list of business centers may be ordered in the document alphabetically based on business center code. An FpML document containing an unordered business center list is still regarded as a conformant document.</td>
</tr>
<tr>
<td><code>businessCenters</code></td>
<td>A container for a set of financial business centers. This set of business centers is used to determine whether a day is a business day or not.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **BusinessCentersReference** ; empty element | FpML BusinessDayAdjustments  
|   | FpML FixingDateOffset |
| A pointer style reference to a set of financial business centers defined elsewhere in the document. This set of business centers is used to determine whether a particular day is a business day or not. |

| **businessDayConvention** ; built-in datatype: string |
| FpML BusinessDayAdjustments |
| The convention for adjusting a date if it would otherwise fall on a day that is not a business day. |

| **buyerPartyReference** ; empty element | FpML Fra |
| A pointer style reference to a party identifier defined elsewhere in the document. The party referenced is the buyer of the instrument, also known as the fixed rate payer. |

| **calculatedRate** ; built-in datatype: decimal |
| FpML FloatingRateDefinition |
| The final calculated rate for a calculation period after any required averaging of rates. A calculated rate of 5% would be represented as 0.05. |

| **calculation** ; entity type: FpML Calculation |
| FpML CalculationPeriodAmount |
| The parameters used in the calculation of fixed or floating rate calculation period amounts. |

<p>| <strong>calculationPeriod</strong> ; entity type: FpML CalculationPeriod |
| FpML PaymentCalculationPeriod |
| The parameters used in the calculation of a fixed or floating rate calculation period amount. A list of calculation period elements may be ordered in the document by ascending adjusted start date. An FpML document which contains an unordered list of calculation periods is still regarded as a conformant document. |</p>

</tbody>
</table>

**FpML CalculationPeriodDates**

**FpML_PaymentCalculationPeriod**

**FpML_CalculationPeriod**

**FpML_Fra**

**FpML_Calculation**

**FpML_ResetDates**

**FpML_FixingDateOffset**
The rates to be applied to the initial or final stub may be the linear interpolation of two different rates. While the majority of the time, the rate indices will be the same as that specified in the stream and only the tenor itself will be different, it is possible to specify two different rates. For example, a 2 month stub period may use the linear interpolation of a 1 month and 3 month rate. The different rates would be specified in this component. Note that a maximum of two rates can be specified. If a stub period uses the same floating rate index, including tenor, as the regular calculation periods then this should not be specified again within this component, i.e. the stub calculation period amount component may not need to be specified even if there is an initial or final stub period. If a stub period uses a different floating rate index compared to the regular calculation periods then this should be specified within this component. If specified here, they are likely to have id attributes, allowing them to be referenced from within the cashflows component.

The floating rate calculation definitions.

The floating rate reset information for the calculation period.

The ISDA Floating Rate Option, i.e. the floating rate index.

The floor rate, if any, which applies to the floating rate for the calculation period. The floor rate is assumed to
be exclusive of any spread and is a per annum rate, expressed as a decimal. A floor rate of 5% would be represented as 0.05.

<td></td>
</tr>
</tbody>
</table>
The final payment is made relative to the final set of calculation periods or the final reset date as the case may be.

### `lastRegularPeriodEndDate`; built-in datatype: `date`

The end date of the regular part of the calculation period schedule. It must only be specified if there is a final stub calculation period.

### `linkId`; built-in datatype: `string`

A link identifier allowing the trade to be associated with other related trades, e.g. the `linkId` may contain a tradeId for an associated trade or several related trades may be given the same `linkId`. FpML does not define the domain values associated with this element. Note that the domain values for this element are not strictly an enumerated list.

### `notional`; entity type: `FpML_Money`

The notional amount.

### `notionalAmount`; built-in datatype: `decimal`

The calculation period notional amount.

### `notionalSchedule`; entity type: `FpML_Notional`

The notional amount or notional amount schedule.

### `notionalStepAmount`; built-in datatype: `decimal`

The explicit amount that the notional changes on each step date. This can be a positive or negative amount.

### `notionalStepParameters`; entity type: `FpML_NotionalStepRule`

A parametric representation of the notional step.
schedule, i.e. parameters used to generate the notional schedule.

<table>

<tbody>
<tr>
<td>If early payment or delayed payment is required, specifies the number of days offset that the payment occurs relative to what would otherwise be the unadjusted payment date. The offset can be specified in terms of either calendar or business days. Even in the case of a calendar days offset, the resulting payment date, adjusted for the specified calendar days offset, will still be adjusted in accordance with the specified payment dates adjustments.</td>
</tr>
<tr>
<td><strong>paymentFrequency</strong> ; entity type: FpML_Interval</td>
</tr>
<tr>
<td>---</td>
</tr>
<tr>
<td>The frequency at which regular payment dates occur. If the payment frequency is equal to the frequency defined in the calculation period dates component then one calculation period contributes to each payment amount. If the payment frequency is less frequent than the frequency defined in the calculation period dates component then more than one calculation period will contribute to each payment amount. A payment frequency more frequent than the calculation period frequency or one that is not a multiple of the calculation period frequency is invalid.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>paymentType</strong> ; built-in datatype: string</th>
<th>FpML_Fee</th>
</tr>
</thead>
<tbody>
<tr>
<td>A classification of the type of fee or additional payment, e.g. brokerage, upfront fee etc. FpML does not define domain values for this element.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>payRelativeTo</strong> ; built-in datatype: string</th>
<th>FpML_PaymentDates</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies whether the payments occur relative to each calculation period start date, calculation period end date or each reset date. The reset date is applicable in the case of certain French Franc floating rate indices. Calculation period start date means relative to the start of the first calculation period contributing to a given payment. Similarly, calculation period end date means the end of the last calculation period contributing to a given payment.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>period</strong> ; built-in datatype: string</th>
<th>FpML_Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>A time period, e.g. a day, week, month or year.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>periodMultiplier</strong> ; built-in datatype: integer</th>
<th>FpML_Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>A time period multiplier, e.g. 1, 2 or 3 etc. A negative value can be used when specifying an offset relative to another date, e.g. -2 days.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>precision</strong> ; built-in datatype: nonNegativeInteger</th>
<th>FpML_Rounding</th>
</tr>
</thead>
</table>
Specifies the rounding precision in terms of a number of decimal places. Note how a percentage rate rounding of 5 decimal places is expressed as a rounding precision of 7 in the FpML document since the percentage is expressed as a decimal, e.g. 9.876543% (or 0.09876543) being rounded to the nearest 5 decimal places is 9.87654% (or 0.0987654).

**principalExchange** ; entity type: FpML_PrincipalExchange

The initial, intermediate and final principal exchange amounts. Typically required on cross currency interest rate swaps where actual exchanges of principal occur. A list of principal exchange elements may be ordered in the document by ascending adjusted principal exchange date. An FpML document containing an unordered principal exchange list is still regarded as a conformant document.

**principalExchangeAmount** ; built-in datatype: decimal

The principal exchange amount. This amount should be positive if the stream payer is paying the exchange amount and signed negative if they are receiving it.

**principalExchanges** ; entity type: FpML_PrincipalExchanges

The true/false flags indicating whether initial, intermediate or final exchanges of principal should occur.

**rateCutOffDaysOffset** ; entity type: FpML_Offset

Specifies the number of business days before the period end date when the rate cut-off date is assumed to apply. The financial business centers associated with determining the rate cut-off date are those specified in the reset dates adjustments. The rate cut-off number of days must be a negative integer. The relative rate for each reset date in the period from, and including, a rate cut-off date to, but excluding, the next applicable period end date (or, in the case of the last calculation period, the termination date) will (solely for purposes of...
calculating the floating amount payable on the next applicable payment date) be deemed to be the relevant rate in effect on that rate cut-off date. For example, if rate cut-off days for a daily averaging deal is -2 business days, then the refix rate applied on (period end date - 2 days) will also be applied as the reset on (period end date - 1 day), i.e. the actual number of reset dates remains the same but from the rate cut-off date until the period end date, the same refix rate is applied. Note that in the case of several calculation periods contributing to a single payment, the rate cut-off is assumed only to apply to the final calculation period contributing to that payment. The day type associated with the offset must imply a business days offset.

<table>
<thead>
<tr>
<th>rateObservation ; entity type: FpML RateObservation</th>
<th>FpML FloatingRateDefinition</th>
</tr>
</thead>
<tbody>
<tr>
<td>The details of a particular rate observation, including the fixing date and observed rate. A list of rate observation elements may be ordered in the document by ascending adjusted fixing date. <table>
<thead>
<tr>
<th>resetRelativeTo ; built-in datatype: string</th>
<th>FpML_ResetDates</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies whether the reset dates are determined with respect to each calculation period start date or calculation period end date. If the reset frequency is specified as daily this element must not be included.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>rollConvention ; built-in datatype: string</th>
<th>FpML_CalculationPeriodFrequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Used in conjunction with a frequency and the regular</td>
<td></td>
</tr>
</tbody>
</table>
period start date of a calculation period, determines each calculation period end date within the regular part of a calculation period schedule.

**roundingDirection**; built-in datatype: string

Specifies the rounding direction.

**sellerPartyReference**; empty element

A pointer style reference to a party identifier defined elsewhere in the document. The party referenced is the seller of the instrument, also known as the floating rate payer.

**spread**; built-in datatype: decimal

The ISDA Spread, if any, which applies for the calculation period. The spread is a per annum rate, expressed as a decimal. For purposes of determining a calculation period amount, if positive the spread will be added to the floating rate and if negative the spread will be subtracted from the floating rate. A positive 10 basis point (0.1%) spread would be represented as 0.001.

**spreadSchedule**; entity type: FpML Schedule

The ISDA Spread or a Spread schedule. The spread is a per annum rate, expressed as a decimal. For purposes of determining a calculation period amount, if positive the spread will be added to the floating rate and if negative the spread will be subtracted from the floating rate. A positive 10 basis point (0.1%) spread would be represented as 0.001.

**step**; entity type: FpML Step

The schedule of step date and value pairs. On each step date the associated step value becomes effective A list of steps may be ordered in the document by ascending step date. An FpML document containing an unordered list of steps is still regarded as a conformant document.

**stepDate**; built-in datatype: date

- 115 -
The date on which the associated stepValue becomes effective. This date may be subject to adjustment in accordance with a business day convention.

<table>
<thead>
<tr>
<th>stepFrequency</th>
<th>entity type: FpML_Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>The frequency at which the step changes occur. This frequency must be a multiple of the stream calculation period frequency.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>stepRelativeTo</th>
<th>built-in datatype: string</th>

<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>stubCalculationPeriodAmount</th>
<th>entity type: FpMLStubCalculationPeriodAmount</th>
</tr>
</thead>
<tbody>
<tr>
<td>The stub calculation period amount parameters. This element must only be included if there is an initial or final stub calculation period. Even then, it must only be included if either the stub references a different floating rate tenor to the regular calculation periods, or if the stub is calculated as a linear interpolation of two different floating rate tenors, or if a specific stub rate or stub amount has been negotiated.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>stubRate</th>
<th>built-in datatype: decimal</th>
</tr>
</thead>
</table>
An actual rate to apply for the initial or final stub period may have been agreed between the principal parties (in a similar way to how an initial rate may have been agreed for the first regular period). If an actual stub rate has been agreed then it would be included in this component. It will be a per annum rate, expressed as a decimal. A stub rate of 5% would be represented as 0.05.

### swap
- **entity type:** FpML_Swap
  - A swap product definition.

### swapStream
- **entity type:** FpML_SwapStream
  - The swap streams.

### terminationDate
- **entity type:** FpML_AdjustableDate
  - The last day of the term of the trade. This day may be subject to adjustment in accordance with a business day convention.

### trade
- **entity type:** FpML_Trade
  - The FpML trade definition.

### tradeDate
- **built-in datatype:** date
  - The trade date.

### tradeHeader
- **entity type:** FpML_TradeHeader
  - The information on the trade which is not product specific, e.g. trade date.

### tradeId
- **built-in datatype:** string
  - A trade reference identifier allocated by a party. FpML does not define the domain values associated with this element. Note that the domain values for this element are not strictly an enumerated list.
<table>
<thead>

</tbody>
</table>
7 CHARACTER ENCODING AND CHARACTER REPERTOIRE

7.1 Character Encoding

Producers of FpML documents intended for interchange with other parties must encode such documents using either UTF-8 or UTF-16. Consumers of FpML documents must be able to process documents encoded using UTF-8, as well as documents encoded using UTF-16. For more information, see http://www.w3.org/TR/REC-xml#charencoding.

7.2 Character Repertoire

FpML element content, as well as values of the FpML id and href attributes, may use any valid XML characters. For more information, see http://www.w3.org/TR/REC-xml#charsets.
8 DATATYPES AND CODING SCHEMES

8.1 Datatypes

FpML 1.0 uses a subset of the built-in datatypes (both primitive and derived datatypes) as defined in XML Schema Part 2: Datatypes, W3C Working Draft 07 April 2000. This draft is currently in Last Call. The built-in datatypes are described at:

The built-in datatypes used in FpML 1.0 are the following:

- boolean
- date
- decimal
- integer
- nonNegativeInteger
- positiveInteger
- string

Additional constraints are imposed by FpML on a number of these built-in datatypes. These constraints are defined below:

8.1.1 boolean

All elements of type boolean in FpML must contain the value true or false.

8.1.2 date

All elements of type date in FpML must contain date values with the format YYYY-MM-DD. For example, 25 May 2000 would be represented in FpML as 2000-05-25.

8.1.3 decimal

All elements of type decimal in FpML must use a lexical representation where the optional leading sign must only be included when representing a negative decimal, i.e. a leading "+" sign is not permitted. When the sign is omitted, "+" is assumed.

For example: -1000, 1000.00, 0.1234 are legal literals for an FpML decimal.

8.1.4 integer

All elements of type integer in FpML must use a lexical representation where the optional leading sign must only be included when representing a negative integer, i.e. a leading "+" sign is not permitted. When the sign is omitted, "+" is assumed.
For example: -1, 0, 1 and 1234 are legal literals for an FpML integer.

8.1.5 nonNegativeInteger

All elements of type nonNegativeInteger in FpML must use a lexical representation where the optional leading "+" sign must not be included. When the sign is omitted, "+" is assumed.

For example: 0, 1 and 1234 are legal literals for an FpML nonNegativeInteger.

8.1.6 positiveInteger

All elements of type positiveInteger in FpML must use a lexical representation where the optional leading "+" sign must not be included. When the sign is omitted, "+" is assumed.

For example: 1 and 1234 are legal literals for an FpML positiveInteger.
8.2 Coding Schemes

8.2.1 Introduction

A number of data elements defined in the FpML 1.0 DTD are restricted to holding one of a limited set of possible values, e.g. dayCountConvention, dayCountFraction, currency etc. Such restricted sets of values are frequently referred to as domains. XML 1.0 has some limited support for the concept of domains through the use of enumerated attributes.

FpML has adopted the principle of not using attributes to hold business data. As a consequence XML enumerations are of little use and an alternative strategy has been defined by the Architecture Working Group referred to as 'schemes'. Each scheme is associated with a URI. Coding schemes can be categorized as one of the following:

- An external coding scheme, which has a well known URI
- An external coding scheme, which does not have a well known URI
- An FpML-defined coding scheme.

In this section, the FpML-controlled schemes and their associated URIs are defined, as well as external coding schemes which do not have well known URIs and are therefore given an FpML-defined URI. The URI construction follows the Architecture Working Group recommendations.

Note that FpML does not define a coding scheme or URI for the following schemes:

- Link Identifier (linkIdScheme)
- Payment Type (paymentTypeScheme)
- Trade Identifier (tradeIdScheme) schemes.

These are currently assumed to be specific to individual organizations or FpML based implementations.

8.2.2 Averaging Method Scheme (averagingMethodScheme)

Definition

The method of calculation to be used when averaging rates.

URI

http://www.fpml.org/spec/averaging-method-1-0

Coding Scheme

<table>
<thead>
<tr>
<th>Code</th>
<th>Defn Source</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unweighted</td>
<td>ISDA</td>
<td>The arithmetic mean of the relevant rates for each reset date.</td>
</tr>
<tr>
<td>Weighted</td>
<td>ISDA</td>
<td>The arithmetic mean of the relevant rates in effect for each day in a calculation period calculated by multiplying each relevant rate by the number of days such relevant rate is in effect, determining the sum of such products and dividing such sum by the number of days in the calculation period.</td>
</tr>
</tbody>
</table>
8.2.3 Business Center Scheme (businessCenterScheme)

**Definition**

A financial business center location.

**URI**

http://www.fpml.org/spec/business-center-1-0

**Code Construction**

In general, the codes are based on the ISO country code and the English name of the location.

Additional location codes can be built according to the following rules. The first two characters represent the ISO country code, the next two characters represent a) if the location name is one word, the first two letters of the location b) if the location name consists of at least two words, the first letter of the first word followed by the first letter of the second word.

There are exceptions to this rule. For example, the TARGET (Trans-European Automated Real-time Gross settlement Express Transfer system) business center for Euro settlement has a code of EUTA.

This coding scheme is currently consistent with the S.W.I.F.T. Financial Centre scheme used in the MT340/MT360/MT361 message definitions, although FpML controls the Business Center Scheme and it should not be assumed that both schemes will remain synchronized.

8.2.4 Business Day Convention Scheme (businessDayConventionScheme)

Definition
The convention for adjusting any relevant date if it would otherwise fall on a day that is not a valid business day. Note that FRN is included here as a type of business day convention although it does not strictly fall within ISDA’s definition of a Business Day Convention and does not conform to the simple definition given above.

URI
http://www.fpml.org/spec/business-day-convention-1-0

Coding Scheme

### 8.2.6 Currency Scheme (currencyScheme)

**Definition**
The code for representation of a currency.

**URI**
http://www.fpml.org/ext/iso4217

**Coding Scheme**

A valid currency code as defined by the ISO standard 4217 - Codes for representation of currencies and funds.
8.2.7 Day Count Fraction Scheme (dayCountFractionScheme)

**Definition**

The specification for how the number of days between two dates is calculated for purposes of calculation of a fixed or floating payment amount and the basis for how many days are assumed to be in a year. Day Count Fraction is an ISDA term. The equivalent AFB (Association Francaise de Banques) term is Calculation Basis.

8.2.10 Floating Rate Index Scheme (floatingRateIndexScheme)

**Definition**
The specification of an ISDA Rate Option or Euro Rate Option for purposes of determining a relevant rate on a given reset date.

**URI**
http://www.fpml.org/spec/floating-rate-index-1-0

**Coding Scheme**

Valid ISDA Rate Options as published by ISDA in the 1991 ISDA Definitions (Section 7.1. Rate Options), amended and supplemented in the 1998 Supplement to the 1991 ISDA Definitions (Section 7.1. Rate Options) and valid Euro Rate Options as published in the 1998 ISDA Euro Definitions (Section 3.1. Euro Rate Options).
8.2.11 Party Identifier Scheme (partyIdScheme)

Definition
The code for identification of parties involved in a trade. Valid bank identifier codes (BICs).

URI
http://www.fpml.org/ext/iso9362

Coding Scheme
Valid BIC codes as defined by the ISO standard 9362 - Bank identifier codes (BIC).

S.W.I.F.T. is the designated registration authority for the assignment of BIC codes. They maintain an online BIC directory at http://www.swift.com/.

8.2.12 Pay Relative To Scheme (payRelativeToScheme)

Definition
The specification of whether payments occur relative to the calculation period start or end date, or the reset date.

URI

9 SAMPLE FPML

9.1 Introduction

This section contains six example FpML swap trades and one FpML forward rate agreement trade. Each swap example illustrates how different product features are modeled in FpML.

The seven examples are the following:

1. Fixed/floating single currency interest rate swap
2. Fixed/floating single currency interest rate swap with initial stub period and notional amortization
3. Fixed/floating single currency interest rate swap with compounding, payment delay and final rate rounding
4. Fixed/floating single currency interest rate swap with arrears reset, step-up coupon and upfront fee
5. Fixed/floating single currency interest rate swap with long initial stub and short final stub
6. Fixed/floating cross currency interest rate swap
7. Forward rate agreement.

Examples 2, 3 and 6 include the optional cashflows representation as part of the FpML sample document. Note that cashflows are not applicable for the forward rate agreement product.

Additionally, Example 5 shows the defaulted 'type' attributes as part of the sample document. This illustrates the additional content model information available to a validating parser when processing an FpML document.
9.2 Example 1 - Fixed/Floating Single Currency Interest Rate Swap

On 12 December, 1994 Chase New York and Barclays Bank London enter into an ISDA swap agreement with each other. The terms of the contract are:

- Effective Date: 14 December, 1994
- Termination Date: 14 December, 1999
- Notional Amount: DEM 50,000,000
- Chase pays the floating rate every 6 months, based on 6M DEM-LIBOR-BBA, on an ACT/360 basis
- Barclays pays the 6% fixed rate every year on a 30E/360 basis
- The swap is non compounding, non amortizing and there are no stub periods. There is no averaging of rates. The business day convention for adjusting the calculation dates is the same as that used for payment date adjustments.

Note the following:

- Optional cashflows are not included in this example.

9.3 Example 2 - Fixed/Floating Single Currency Interest Rate Swap with Initial Stub Period and Notional Amortization

The swap contract is identical to Example 1 except that there is an initial stub period and the notional amortizes.

The rate for the stub period is the linear interpolation between the 4M and 5M DEM-LIBOR-BBA rates.

The notional amount is decreased by DEM 10,000,000 each year.

Note the following:

- Optional cashflows are included. An assumption that all weekdays are good business days has been made in calculating the adjusted dates in the cashflows.

9.4 Example 3 - Fixed/Floating Single Currency Interest Rate Swap with Compounding, Payment Delay and Final Rate Rounding

On 25 April, 2000 Morgan Stanley Dean Witter and J.P. Morgan enter into an ISDA swap agreement with each other. The terms of the contract are:

- Effective Date: 27 April, 2000
- Termination Date: 27 April, 2002
- Notional Amount: USD 100,000,000
- J.P. Morgan pays the 5.85% fixed rate semi-annually on a 30/360 basis.
- Morgan Stanley Dean Witter pays the floating rate semi-annually, based on 3M USD-LIBOR-BBA reset and compounded flat quarterly, on an ACT/360 basis. The compounded rate to be used for calculating each floating payment amount will be rounded to the nearest 5 decimal places. Note how a percentage rate rounding of 5 decimal places is expressed as a rounding precision of 7 in the FpML document since the percentage is expressed as a decimal, e.g. 9.876543% (or 0.09876543) being rounded to the nearest 5 decimal places is 9.87654% (or 0.0987654)
- The business day convention for adjusting the calculation dates is the same as that used for payment date adjustments. There is a payment delay of 5 business days.

Note that optional cashflows are included. An assumption that all weekdays are good business days has been made in calculating the adjusted dates in the cashflows.

9.5  Example 4 - Fixed/Floating Single Currency Interest Rate Swap with Arrears Reset, Step-Up Coupon and Upfront Fee

On 25 April, 2000 Morgan Stanley Dean Witter and J.P. Morgan enter into an ISDA swap agreement with each other. The terms of the contract are:

- Effective Date: 27 April, 2000
- Termination Date: 27 April, 2002
- Notional amount: USD 100,000,000
- J.P. Morgan pays a 6.0% fixed rate semi-annually on a 30/360 basis for the first year and a fixed rate of 6.5% for the final year
- Morgan Stanley Dean Witter pays the floating rate quarterly, based on 3M USD-LIBOR-BBA reset in arrears, on an ACT/360 basis
- There is no adjustment to period end dates on the fixed stream, i.e. the business day convention used for adjusting the payment dates does not apply for adjusting the calculation dates
- There is an upfront fee of USD 15,000 payable by Morgan Stanley Dean Witter to J.P. Morgan on the Effective Date.

Note that the optional cashflows are not included in this example.

9.6 Example 5 - Fixed/Floating Single Currency Interest Rate Swap with Long Initial Stub and Short Final Stub

On 3 April, 2000 Chase and UBS Warburg enter into an ISDA swap agreement with each other. The terms of the contract are:

- **Effective Date**: 5 April, 2000
- **Termination Date**: 5 January, 2005
- **Notional Amount**: EUR 75,000,000
- Chase pays the floating rate every 6 months, based on 6M EUR-EURIBOR-TELERATE plus 10 basis points spread, on an ACT/360 basis
- UBS Warburg pays the 5.25% fixed rate every year on a 30/360 basis
- There is a long initial stub period of 7 months. The first period runs from 5 March, 2000 to 5 October, 2000 and an initial stub rate of 5.125% has been agreed for this period on the floating stream
- There is a short final stub period of 3 months. The final period runs from 5 October, 2004 to 5 January, 2005 and the 3M EUR-EURIBOR-TELERATE rate will be used for this period on the floating stream
- The business day convention for adjusting the calculation dates is the same as that used for payment date adjustments.

Note the following:

- The optional cashflows are not shown in this example
- This example shows the defaulted 'type' attributes to illustrate the additional content model information available to a validating parser. Whilst it is not invalid to include this information in the XML document instance, it is not recommended to do so, as any inconsistencies between the type information specified in the document and that in the DTD will result in a well formed but invalid FpML document.

9.7 Example 6 - Fixed/ Floating Cross Currency Interest Rate Swap

On 12 December, 1994 Chase New York and Barclays Bank London enter into an ISDA cross-currency swap agreement with each other. The terms of the contract are:

- Effective Date: 14 December, 1994
- Termination Date: 14 December, 1999
- Chase pays the floating rate every 6 months, based on 6M USD-LIBOR-BBA, on USD 10,000,000 and an ACT/360 basis
- Barclays pays the 6% fixed rate every year on JPY 1,000,000,000 and a 30E/360 basis
- The swap is non compounding, non amortizing and there are no stub periods. There is no averaging of rates. The business day convention for adjusting the calculation dates is the same as that used for payment date adjustments.

Note the following:

- Optional cashflows are included. An assumption that all weekdays are good business days has been made in calculating the adjusted dates in the cashflows.
