1 Global Elements

1.1 americanExercise

1.1.1 Description:

The parameters for defining the exercise period for an American style option together with any rules governing the notional amount of the underlying which can be exercised on any given exercise date and any associated exercise fees.

1.1.2 Contents:

Element americanExercise is defined by the complex type AmericanExercise

1.1.3 Used by:

1.1.4 Substituted by:

1.1.5 Figure:

1.1.6 Schema Fragment:

```
<xsd:element name="americanExercise" type="AmericanExercise" substitutionGroup="exercise">
  <xsd:annotation>
    <xsd:documentation xml:lang="en">
      The parameters for defining the exercise period for an American
      style option together with any rules governing the notional
      amount of the underlying which can be exercised on any given
      exercise date and any associated exercise fees.
    </xsd:documentation>
  </xsd:annotation>
</xsd:element>
```

```
</xsd:annotation>  
</xsd:element>
```

1.2 bermudaExercise

1.2.1 Description:

The parameters for defining the exercise period for a Bermuda style option together with any rules governing the notional amount of the underlying which can be exercised on any given exercise date and any associated exercise fees.

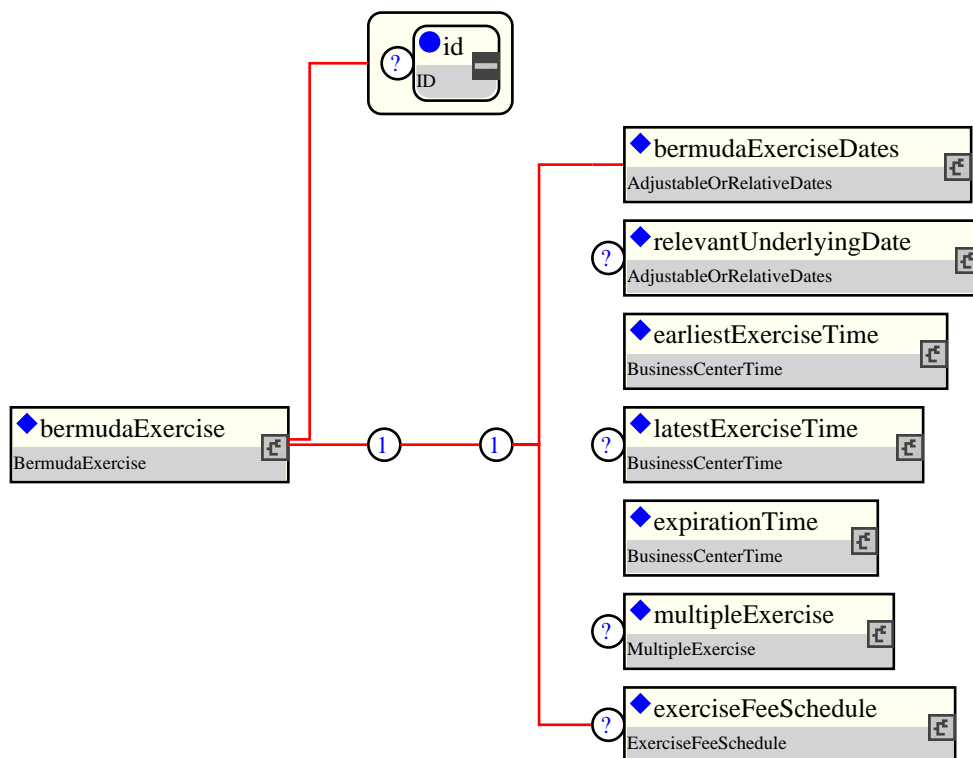

1.2.2 Contents:

Element bermudaExercise is defined by the complex type BermudaExercise

1.2.3 Used by:

1.2.4 Substituted by:

1.2.5 Figure:

1.2.6 Schema Fragment:

```
<xsd:element name="bermudaExercise" type="BermudaExercise" substitutionGroup="exercise">
  <xsd:annotation>
    <xsd:documentation xml:lang="en">
      The parameters for defining the exercise period for a Bermuda
      style option together with any rules governing the notional

      exercise date and any associated exercise fees.
    </xsd:documentation>
  </xsd:annotation>
</xsd:element>
```

1.4 exercise

1.4.1 Description:

An placeholder for the actual option exercise definitions.

1.4.2 Contents:

Element exercise is defined by the complex type Exercise

1.4.3 Used by:

- Complex type: CancelableProvision
- Complex type: ExtendibleProvision
- Complex type: OptionalEarlyTermination
- Complex type: Swaption

1.4.4 Substituted by:

- Element: americanExercise
- Element: bermudaExercise
- Element: europeanExercise

1.4.5 Figure:

1.4.6 Schema Fragment:

  </xsd:annotation>
</xsd:element>
```

1.5 product

1.5.1 Description:

An abstract element used as a place holder for the substituting product elements.

1.5.2 Contents:

Element product is defined by the complex type Product

1.5.3 Used by:

- Complex type: RequestQuoteResponse
- Complex type: Strategy
- Complex type: Trade

1.5.4 Substituted by:

- Element: brokerEquityOption
- Element: bulletPayment
- Element: capFloor
- Element: creditDefaultSwap
- Element: equityForward
- Element: equityOption
- Element: equityOptionTransactionSupplement
- Element: equitySwap

      An abstract element used as a place holder for the substituting
      product elements.
    </xsd:documentation>
  </xsd:annotation>
</xsd:element>
```

2 Global Complex Types

2.1 Address

2.1.1 Description:

A type that represents a physical postal address.

2.1.2 Contents:

streetAddress (zero or one occurrence; of the type `StreetAddress`) The set of street and building number information that identifies a postal address within a city.

city (zero or one occurrence; of the type `xsd:string`) The city component of a postal address.

state (zero or one occurrence; of the type `xsd:string`) A country subdivision used in postal addresses in some countries. For example, US states, Canadian provinces, Swiss cantons.

country (zero or one occurrence; of the type `Country`) The ISO 3166 standard code for the country within which the postal address is located.

postalCode (zero or one occurrence; of the type `xsd:string`) The code, required for computerised mail sorting systems, that is allocated to a physical address by a national postal authority.

2.2 AdjustableDate

2.2.1 Description:

A type for defining a date that shall be subject to adjustment if it would otherwise fall on a day that is not a business day in the specified business centers, together with the convention for adjusting the date.

2.2.2 Contents:

unadjustedDate (exactly one occurrence; of the type IdentifiedDate) A date subject to adjustment.

dateAdjustments (exactly one occurrence; of the type BusinessDayAdjustments) The business day convention and financial business centers used for adjusting the date if it would otherwise fall on a day that is not a business date in the specified business centers.

2.2.3 Used by:

- Complex type: AdjustableDateOrRelativeDateSequence
- Complex type: AdjustableOrRelativeDate
- Complex type: CalculationPeriodDates
- Complex type: DividendPaymentDate
- Complex type: EquityOptionTermination
- Complex type: EquityPremium
- Complex type: Fra
- Complex type: MandatoryEarlyTermination
- Complex type: Payment

2.3 AdjustableDate2

2.3.1 Description:

A type that is different from AdjustableDate in two regards. First, date adjustments can be specified with either a dateAdjustments element or a reference to an existing dateAdjustments element. Second, it does not require the specification of date adjustments.

2.3.2 Contents:

unadjustedDate (exactly one occurrence; of the type IdentifiedDate) A date subject to adjustment.

Either

dateAdjustments (exactly one occurrence; of the type BusinessDayAdjustments) The business day convention and financial business centers used for adjusting the date if it would otherwise fall on a day that is not a business dat in the specified business centers.

Or

dateAdjustmentsReference (exactly one occurrence; of the type Reference) A pointer style reference to date adjustments defined elsewhere in the document.

2.3.3 Used by:

- Complex type: GeneralTerms
- Complex type: PaymentDetail
- Complex type: ScheduledTerminationDate
- Complex type: TradeDetails

```

2.8 AdjustedRelativeDateOffset

2.8.1 Description:

A type defining a date (referred to as the derived date) as a relative offset from another date (referred to as the anchor date) plus optional date adjustments.

2.8.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type RelativeDateOffset)

- A type defining a date (referred to as the derived date) as a relative offset from another date (referred to as the anchor date). If the anchor date is itself an adjustable date then the offset is assumed to be calculated from the adjusted anchor date. A number of different scenarios can be supported, namely; 1) the derived date may simply be a number of calendar periods (days, weeks, months or years) preceding or following the anchor date; 2) the unadjusted derived date may be a number of calendar periods(days, weeks, months or years) preceding or following the anchor date with the resulting unadjusted derived date subject to adjustment in accordance with a specified business day convention, i.e. the derived date must fall on a good business day; 3) the derived date may be a number of business days preceding or following the anchor date. Note that the businessDayConvention specifies any required adjustment to the unadjusted derived date. A negative or positive value in the periodMultiplier indicates whether the unadjusted derived precedes or follows the anchor date. The businessDayConvention should contain a value NONE if the day type element contains a value of Business (since specifying a negative or positive business days offset would already guarantee that the derived date would fall on a good business day in the specified business centers).

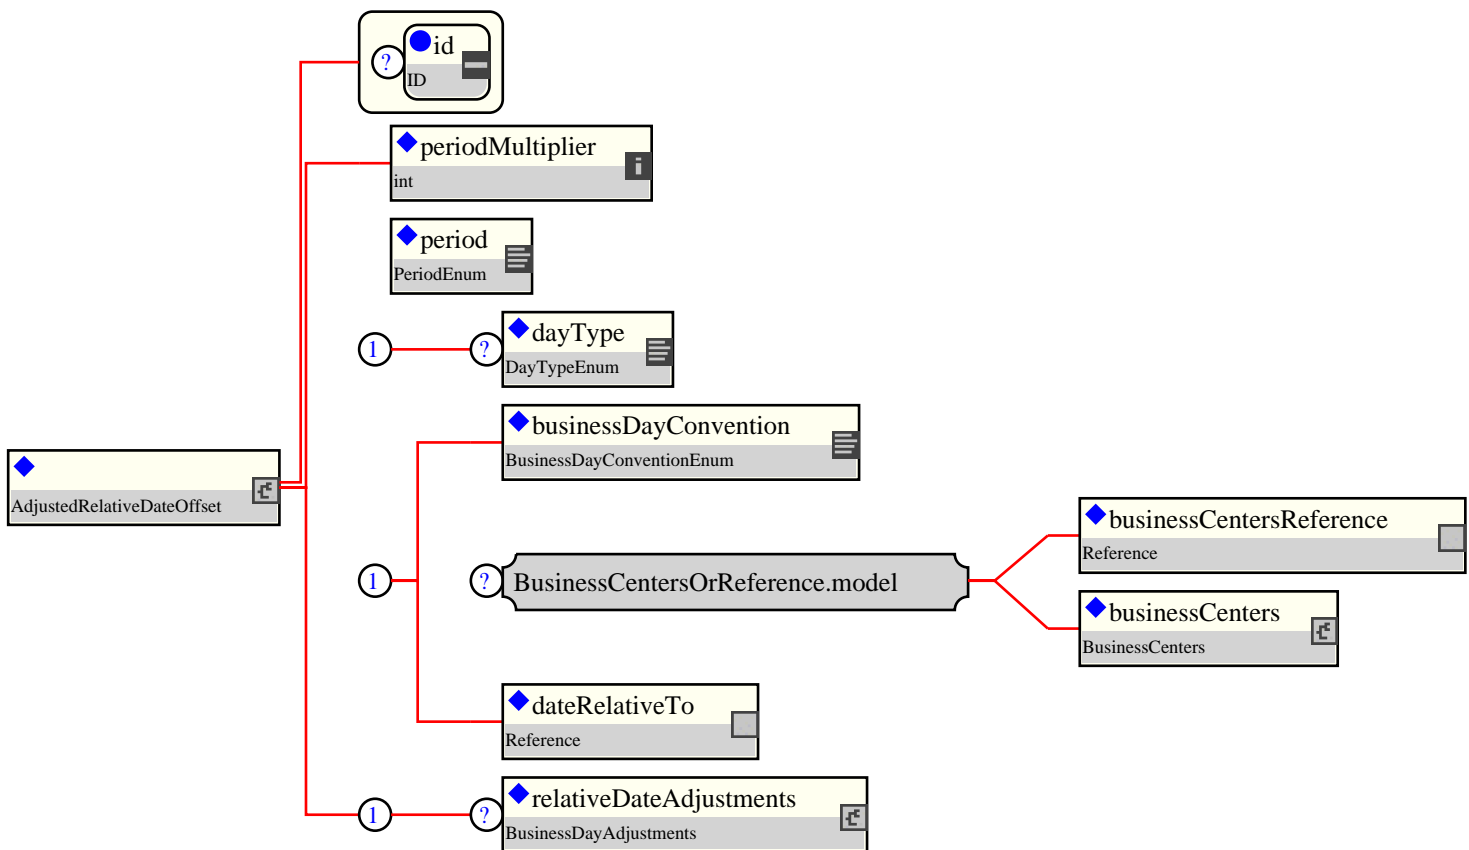

relativeDateAdjustments (zero or one occurrence; of the type BusinessDayAdjustments) The business day convention and financial business centers used for adjusting the relative date if it would otherwise fall on a day that is not a business date in the specified business centers.

2.8.3 Used by:

- Complex type: CalculationPeriodDates

2.8.4 Derived Types:

2.8.5 Figure:

2.9 AmericanExercise

2.9.1 Description:

A type defining the exercise period for an American style option together with any rules governing the notional amount of the underlying which can be exercised on any given exercise date and any associated exercise fees.

2.9.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Exercise)

- The abstract base class for all types which define way in which options may be exercised.

commencementDate (exactly one occurrence; of the type AdjustableOrRelativeDate) The first day of the exercise period for an American style option.

expirationDate (exactly one occurrence; of the type AdjustableOrRelativeDate) The last day within an exercise period for an American style option. For a European style option it is the only day within the exercise period.

relevantUnderlyingDate (zero or one occurrence; of the type AdjustableOrRelativeDates) The day on the underlying set by the exercise of an option. What this date is depends on the option (e.g. in a swaption it is the effective date, in an extendible/cancelable provision it is the termination date).

earliestExerciseTime (exactly one occurrence; of the type BusinessCenterTime) The earliest time at which notice of exercise can be given by the buyer to the seller (or seller's agent) i) on the expiration date, in the case of a European style option, (ii) on each bermuda option exercise date and the expiration date, in the case of a Bermuda style option the commencement date to, and including, the expiration date, in the case of an American option.

latestExerciseTime (zero or one occurrence; of the type BusinessCenterTime) For a Bermuda or American style option, the latest time on an exercise business day (excluding the expiration date) within the exercise period that notice can be given by the buyer to the seller or seller's agent. Notice of exercise given after this time will be deemed to have been given on the next exercise business day.

expirationTime (exactly one occurrence; of the type BusinessCenterTime) The latest time for exercise on expirationDate.

multipleExercise (zero or one occurrence; of the type MultipleExercise) As defined in the 2000 ISDA Definitions, Section 12.4. Multiple Exercise, the buyer of the option has the right to exercise all or less than all the unexercised notional amount of the underlying swap on one or more days in the exercise period, but on any such day may not exercise less than the minimum notional amount or more than the maximum notional amount, and if an integral multiple amount is specified, the notional amount exercised must be equal to, or be an integral multiple of, the integral multiple amount.

exerciseFeeSchedule (zero or one occurrence; of the type ExerciseFeeSchedule) The fees associated with an exercise date. The fees are conditional on the exercise occurring. The fees can be specified as actual currency amounts or as percentages of the notional amount being exercised.

2.10 AmountSchedule

2.10.1 Description:

A type defining a currency amount or a currency amount schedule.

2.10.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Schedule)

- A type defining a schedule of rates or amounts in terms of an initial value and then a series of step date and value pairs. On each step date the rate or amount changes to the new step value. The series of step date and value pairs are optional. If not specified, this implies that the initial value remains unchanged over time.

currency (exactly one occurrence; of the type Currency) The currency in which an amount is denominated.

2.10.3 Used by:

- Complex type: CalculationPeriodAmount
- Complex type: ExerciseFeeSchedule
- Complex type: Notional

2.10.4 Derived Types:

2.10.5 Figure:

2.12 BermudaExercise

2.12.1 Description:

A type defining the Bermuda option exercise dates and the expiration date together with any rules governing the notional amount of the underlying which can be exercised on any given exercise date and any associated exercise fee.

2.12.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Exercise)

- The abstract base class for all types which define way in which options may be exercised.

bermudaExerciseDates (exactly one occurrence; of the type AdjustableOrRelativeDates) The dates the define the Bermuda option exercise dates and the expiration date. The last specified date is assumed to be the expiration date. The dates can either be specified as a series of explicit dates and associated adjustments or as a series of dates defined relative to another schedule of dates, for example, the calculation period start dates. Where a relative series of dates are defined the first and last possible exercise dates can be separately specified.

relevantUnderlyingDate (zero or one occurrence; of the type AdjustableOrRelativeDates) The day on the underlying set by the exercise of an option. What this date is depends on the option (e.g. in a swaption it is the effective date, in an extendible/cancelable provision it is the termination date).

earliestExerciseTime (exactly one occurrence; of the type BusinessCenterTime) The earliest time at which notice of exercise can be given by the buyer to the seller (or seller's agent) i) on the expiration date, in the case of a European style option, (ii) on each bermuda option exercise date and the expiration date, in the case of a Bermuda style option the commencement date to, and including, the expiration date, in the case of an American option.

latestExerciseTime (zero or one occurrence; of the type BusinessCenterTime) For a Bermuda or American style option, the latest time on an exercise business day (excluding the expiration date) within the exercise period that notice can be given by the buyer to the seller or seller's agent. Notice of exercise given after this time will be deemed to have been given on the next exercise business day.

expirationTime (exactly one occurrence; of the type BusinessCenterTime) The latest time for exercise on expirationDate.

multipleExercise (zero or one occurrence; of the type MultipleExercise) As defined in the 2000 ISDA Definitions, Section 12.4. Multiple Exercise, the buyer of the option has the right to exercise all or less than all the unexercised notional amount of the underlying swap on one or more days in the exercise period, but on any such day may not exercise less than the minimum notional amount or more than the maximum notional amount, and if an integral multiple amount is specified, the notional amount exercised must be equal to, or be an integral multiple of, the integral multiple amount.

exerciseFeeSchedule (zero or one occurrence; of the type ExerciseFeeSchedule) The fees associated with an exercise date. The fees are conditional on the exercise occurring. The fees can be specified as actual currency amounts or as percentages of the notional amount being exercised.

2.18 BusinessDateRange

2.18.1 Description:

A type defining a range of contiguous business days by defining an unadjusted first date, an unadjusted last date and a business day convention and business centers for adjusting the first and last dates if they would otherwise fall on a non business day in the specified business centers. The days between the first and last date must also be good business days in the specified centers to be counted in the range.

2.18.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type DateRange)

- A type defining a contiguous series of calendar dates. The date range is defined as all the dates between and including the first and the last date. The first date must fall before the last date.

businessDayConvention (exactly one occurrence; of the type BusinessDayConventionEnum) The convention for adjusting a date if it would otherwise fall on a day that is not a business day.

Either

businessCentersReference (exactly one occurrence; of the type Reference) A pointer style reference to a set of financial business centers defined elsewhere in the document. This set of business centers is used to determine whether a particular day is a business day or not.

Or

businessCenters (exactly one occurrence; of the type BusinessCenters)

2.18.3 Used by:

2.20 CalculationAgent

2.20.1 Description:

A type defining the ISDA calculation agent responsible for performing duties as defined in the applicable product definitions.

2.20.2 Contents:

Either

calculationAgentPartyReference (one or more occurrences; of the type Reference) A pointer style reference to a party identifier defined elsewhere in the document. The party referenced is the ISDA Calculation Agent for the trade. If more than one party is referenced then the parties are assumed to be co-calculation agents, i.e. they have joint responsibility.

Or

calculationAgentParty (exactly one occurrence; of the type CalculationAgentPartyEnum) The ISDA Calculation Agent where the actual party responsible for performing the duties associated with an optional early termination provision will be determined at exercise. For example, the Calculation Agent may be defined as being the Non-exercising Party.

2.20.3 Used by:

- Complex type: MandatoryEarlyTermination
- Complex type: OptionalEarlyTermination
- Complex type: Swaption
- Complex type: Trade

2.20.4 Derived Types:

2.21 CalculationPeriodFrequency

2.21.1 Description:

A type defining the frequency at which calculation period end dates occur within the regular part of the calculation period schedule and thier roll date convention.

2.21.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Interval)

- A type defining a time interval or offset, e.g. one day, three months. Used for specifying frequencies at which events occur, the tenor of a floating rate or an offset relative to another date.

rollConvention (exactly one occurrence; of the type RollConventionEnum) Used in conjunction with a frequency and the regular period start date of a calculation period, determines each calculation period end date within the regular part of a calculation period schedule.

2.21.3 Used by:

- Complex type: CalculationPeriodDates
- Complex type: FxAverageRateObservationSchedule
- Complex type: PeriodicDates

2.21.4 Derived Types:

2.21.5 Figure:

2.21.6 Schema Fragment:

</xsd:complexType>
```

2.25 ContractualMatrix

2.25.1 Description:

2.25.2 Contents:

matrixType (exactly one occurrence; of the type MatrixType) Identifies the form of applicable matrix.

publicationDate (zero or one occurrence; of the type xsd:date) Specifies the publication date of the applicable version of the matrix. When this element is omitted, the ISDA supplemental language for incorporation of the relevant matrix will generally define rules for which version of the matrix is applicable.

matrixTerm (zero or one occurrence; of the type MatrixTerm) Defines any applicable “key” into the relevant matrix. For example, the Transaction Type would be the single term required for the Credit Derivatives Physical Settlement Matrix. This element should be omitted in the case of the 2000 ISDA Definitions Settlement Matrix for Early Termination and Swaptions.

2.25.3 Used by:

- Complex type: Documentation

2.25.4 Derived Types:

2.25.5 Figure:

2.25.6 Schema Fragment:

  <xsd:sequence>
    <xsd:element name="date" type="xsd:date" maxOccurs="unbounded"/>
  </xsd:sequence>
</xsd:complexType>
```

2.32 DateOffset

2.32.1 Description:

2.32.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Offset)

- A type defining an offset used in calculating a new date relative to a reference date. Currently, the only offsets defined are expected to be expressed as either calendar or business day offsets.

businessDayConvention (exactly one occurrence; of the type BusinessDayConventionEnum) The convention for adjusting a date if it would otherwise fall on a day that is not a business day.

sequence (zero or one occurrence; of the type xsd:integer) Sequence in which the reference to the time period multiplier should be applied.

2.32.3 Used by:

- Complex type: RelativeDateSequence

2.32.4 Derived Types:

2.32.5 Figure:

2.32.6 Schema Fragment:

</xsd:extension>
</xsd:complexContent>
</xsd:complexType>
```

2.33 DateRange

2.33.1 Description:

A type defining a contiguous series of calendar dates. The date range is defined as all the dates between and including the first and the last date. The first date must fall before the last date.

2.33.2 Contents:

unadjustedFirstDate (exactly one occurrence; of the type xsd:date) The first date of a date range.

unadjustedLastDate (exactly one occurrence; of the type xsd:date) The last date of a date range.

2.33.3 Used by:

- Complex type: BusinessDateRange
- Complex type: RelativeDates

2.33.4 Derived Types:

- Complex type: BusinessDateRange

2.33.5 Figure:

```

2.37 DividendConditions

2.37.1 Description:

A type describing the conditions governing the payment of dividends to the receiver of the equity return. With the exception of the dividend payout ratio, which is defined for each of the underlying components.

2.37.2 Contents:

dividendReinvestment (zero or one occurrence; of the type xsd:boolean) Boolean element that defines whether the dividend will be reinvested or not.

dividendEntitlement (zero or one occurrence; of the type DividendEntitlementEnum) Defines the date on which the receiver on the equity return is entitled to the dividend.

dividendAmount (zero or one occurrence; of the type DividendAmountTypeEnum)

dividendPaymentDate (zero or one occurrence; of the type DividendPaymentDate) Specifies when the dividend will be paid to the receiver of the equity return. Has the meaning as defined in the ISDA 2002 Equity Derivatives Definitions. Is not applicable in the case of a dividend reinvestment election.

Either

dividendPeriod (exactly one occurrence; of the type DividendPeriodEnum) Defines the First Period or the Second Period, as defined in the 2002 ISDA Equity Derivatives Definitions.

extraOrdinaryDividends (zero or one occurrence; of the type Reference) Reference to the party which determines if dividends are extraordinary in relation to normal levels.

excessDividendAmount (zero or one occurrence; of the type DividendAmountTypeEnum) Determination of Gross Cash Dividend per Share

paymentCurrency (zero or one occurrence; of the type PaymentCurrency) Currency in which the payment relating to the leg amount (equity amount or interest amount) or the dividend will be denominated.

dividendFxTriggerDate (zero or one occurrence; of the type DividendPaymentDate) Specifies the date on which the FX rate will be considered in the case of a Composite FX swap.

interestAccrualsMethod (zero or one occurrence; of the type InterestAccrualsCompoundingMethod) Defines the way in which interests are accrued: the applicable rate (fixed or floating reference) and the compounding method.

2.37.3 Used by:

- Complex type: EquityDerivativeLongFormBase
- Complex type: Return

2.37.4 Derived Types:

2.38 DividendPaymentDate

2.38.1 Description:

A type describing the date on which the dividend will be paid/received. This type is also used to specify the date on which the FX rate will be determined, when applicable.

2.38.2 Contents:

Either

dividendDateReference (exactly one occurrence; of the type DividendDateReferenceEnum) Reference to a dividend date, either the pay date, the ex date or the record date.

Or

adjustableDate (exactly one occurrence; of the type AdjustableDate) A date that shall be subject to adjustment if it would otherwise fall on a day that is not a business day in the specified business centers, together with the convention for adjusting the date.

2.38.3 Used by:

- Complex type: DividendConditions

2.39 Documentation

2.39.1 Description:

An entity for defining the definitions that govern the document and should include the year and type of definitions referenced, along with any relevant documentation (such as master agreement) and the date it was signed.

2.39.2 Contents:

masterAgreement (zero or one occurrence; of the type MasterAgreement) The agreement executed between the parties and intended to govern all OTC derivatives transactions between those parties.

Either

masterConfirmation (exactly one occurrence; of the type MasterConfirmation) The agreement executed between the parties and intended to govern all OTC derivatives transactions between those parties.

Or

brokerConfirmation (exactly one occurrence; of the type BrokerConfirmation) Specifies the details for a broker confirm.

contractualDefinitions (zero or more occurrences; of the type ContractualDefinitions) The definitions (such as those published by ISDA) published by ISDA that will define the terms of the trade.

Either

contractualSupplement (zero or more occurrences; of the type ContractualSupplement) DEPRECATED - This element will be removed in the next major version of FpML. The element contractualTermsSupplement should be used instead. Definition: A contractual supplement (such as those published by ISDA) that will apply to the trade.

Or

contractualTermsSupplement (zero or more occurrences; of the type ContractualTermsSupplement) A contractual supplement (such as those published by ISDA) that will apply to the trade.

contractualMatrix (zero or more occurrences; of the type ContractualMatrix) A reference to a contractual matrix of elected terms/values (such as those published by ISDA) that shall be deemed to apply to the trade. The applicable matrix is identified by reference to a name and optionally a publication date. Depending on the structure of the matrix, an additional term (specified in the matrixTerm element) may be required to further identify a subset of applicable terms/values within the matrix.

creditSupportDocument (zero or one occurrence; of the type xsd:normalizedString) The agreement executed between the parties and intended to govern collateral arrangement for all OTC derivatives transactions between those parties.

2.43 EuropeanExercise

2.43.1 Description:

A type defining the exercise period for a European style option together with any rules governing the notional amount of the underlying which can be exercised on any given exercise date and any associated exercise fees.

2.43.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Exercise)

- The abstract base class for all types which define way in which options may be exercised.

expirationDate (exactly one occurrence; of the type AdjustableOrRelativeDate) The last day within an exercise period for an American style option. For a European style option it is the only day within the exercise period.

relevantUnderlyingDate (zero or one occurrence; of the type AdjustableOrRelativeDates) The day on the underlying set by the exercise of an option. What this date is depends on the option (e.g. in a swaption it is the effective date, in an extendible/cancelable provision it is the termination date).

earliestExerciseTime (exactly one occurrence; of the type BusinessCenterTime) The earliest time at which notice of exercise can be given by the buyer to the seller (or seller's agent) i) on the expiration date, in the case of a European style option, (ii) on each bermuda option exercise date and the expiration date, in the case of a Bermuda style option the commencement date to, and including, the expiration date, in the case of an American option.

expirationTime (exactly one occurrence; of the type BusinessCenterTime) The latest time for exercise on expirationDate.

partialExercise (zero or one occurrence; of the type PartialExercise) As defined in the 2000 ISDA Definitions, Section 12.3. Partial Exercise, the buyer of the option has the right to exercise all or less than all the notional amount of the underlying swap on the expiration date, but may not exercise less than the minimum notional amount, and if an integral multiple amount is specified, the notional amount exercised must be equal to, or be an integral multiple of, the integral multiple amount.

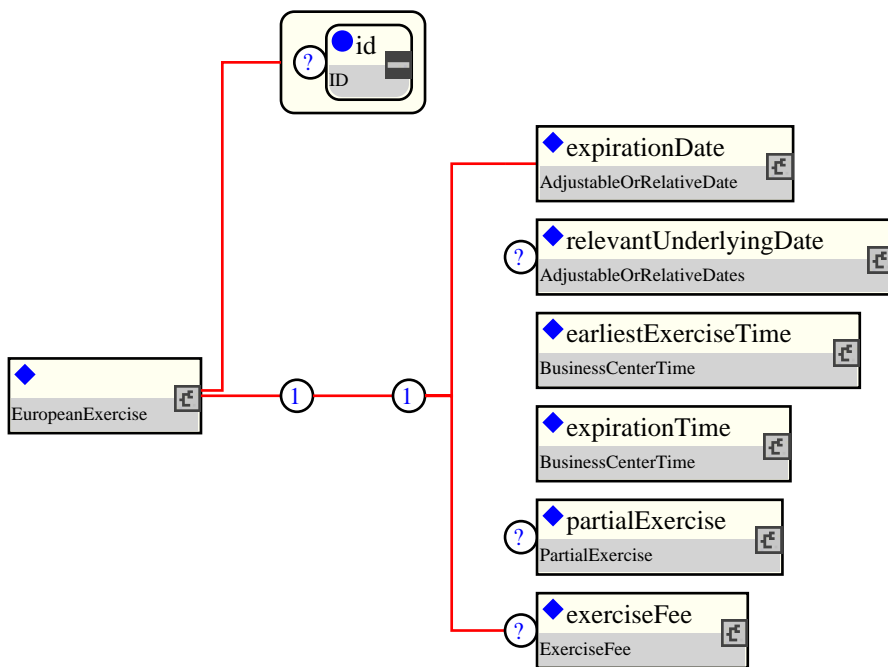

exerciseFee (zero or one occurrence; of the type ExerciseFee) A fee to be paid on exercise. This could be represented as an amount or a rate and notional reference on which to apply the rate.

2.43.3 Used by:

2.46 ExerciseFee

2.46.1 Description:

A type defining the fee payable on exercise of an option. This fee may be defined as an amount or a percentage of the notional exercised.

2.46.2 Contents:

payerPartyReference (exactly one occurrence; of the type Reference) A reference to the party responsible for making the payments defined by this structure.

receiverPartyReference (exactly one occurrence; of the type Reference) A reference to the party that receives the payments corresponding to this structure.

notionalReference (exactly one occurrence; of the type Reference) A pointer style reference to the associated notional schedule defined elsewhere in the document.

Either

feeAmount (exactly one occurrence; of the type xsd:decimal) The amount of fee to be paid on exercise. The fee currency is that of the referenced notional.

Or

feeRate (exactly one occurrence; of the type xsd:decimal) A fee represented as a percentage of some referenced notional. A percentage of 5% would be represented as 0.05.

feePaymentDate (exactly one occurrence; of the type RelativeDateOffset) The date on which exercise fee(s) will be paid. It is specified as a relative date.

2.46.3 Used by:

2.47 ExerciseFeeSchedule

2.47.1 Description:

A type to define a fee or schedule of fees to be payable on the exercise of an option. This fee may be defined as an amount or a percentage of the notional exercised.

2.47.2 Contents:

payerPartyReference (exactly one occurrence; of the type Reference) A reference to the party responsible for making the payments defined by this structure.

receiverPartyReference (exactly one occurrence; of the type Reference) A reference to the party that receives the payments corresponding to this structure.

notionalReference (exactly one occurrence; of the type Reference) A pointer style reference to the associated notional schedule defined elsewhere in the document.

Either

feeAmountSchedule (exactly one occurrence; of the type AmountSchedule) The exercise fee amount schedule. The fees are expressed as currency amounts. The currency of the fee is assumed to be that of the notional schedule referenced.

Or

feeRateSchedule (exactly one occurrence; of the type Schedule) The exercise free rate schedule. The fees are expressed as percentage rates of the notional being exercised. The currency of the fee is assumed to be that of the notional schedule referenced.

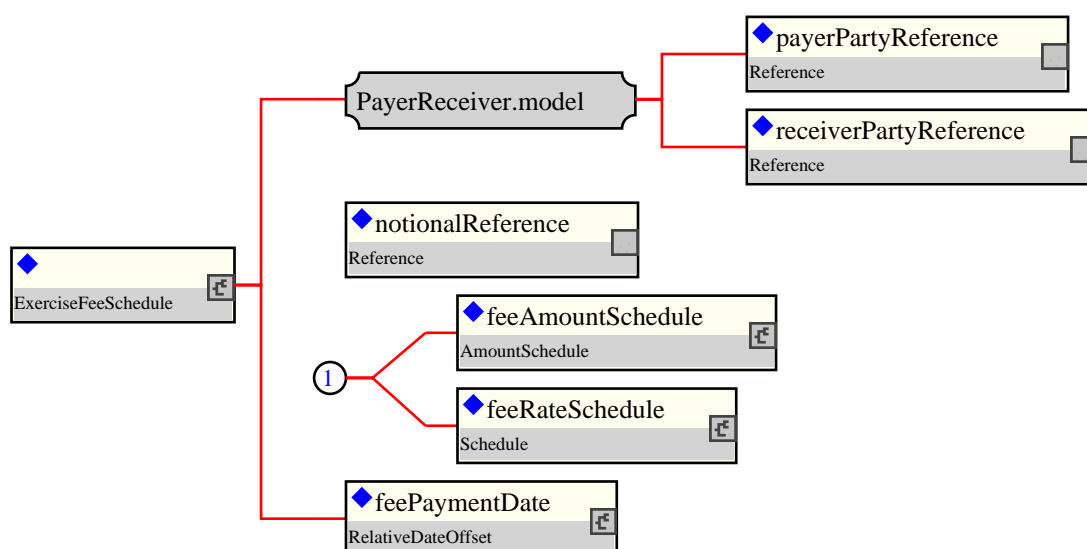

feePaymentDate (exactly one occurrence; of the type RelativeDateOffset) The date on which exercise fee(s) will be paid. It is specified as a relative date.

2.47.3 Used by:

- Complex type: AmericanExercise
- Complex type: BermudaExercise

2.48 ExerciseNotice

2.48.1 Description:

A type defining to whom and where notice of execution should be given. The partyReference refers to one of the principal parties of the trade. If present the exerciseNoticePartyReference refers to a party, other than the principal party, to whom notice should be given.

2.48.2 Contents:

partyReference (exactly one occurrence; of the type Reference) A pointer style reference to a party identifier defined elsewhere in the document. The party referenced has allocated the trade identifier.

exerciseNoticePartyReference (zero or one occurrence; of the type Reference) A pointer style reference to a party identifier defined elsewhere in the document. The party referenced is the party to which notice of exercise should be given by the buyer.

businessCenter (exactly one occurrence; of the type BusinessCenter)

2.48.3 Used by:

- Complex type: CancelableProvision
- Complex type: ExtendibleProvision
- Complex type: ManualExercise
- Complex type: OptionalEarlyTermination

2.49 ExerciseProcedure

2.49.1 Description:

A type describing how notice of exercise should be given. This can be either manual or automatic.

2.49.2 Contents:

Either

manualExercise (exactly one occurrence; of the type ManualExercise) Specifies that the notice of exercise must be given by the buyer to the seller or seller's agent.

Or

automaticExercise (exactly one occurrence; of the type AutomaticExercise) If automatic is specified then the notional amount of the underlying swap, not previously exercised under the swaption will be automatically exercised at the expiration time on the expiration date if at such time the buyer is in-the-money, provided that the difference between the settlement rate and the fixed rate under the relevant underlying swap is not less than the specified threshold rate. The term in-the-money is assumed to have the meaning defining in the 2000 ISDA Definitions, Section 17.4 In-the-money.

followUpConfirmation (exactly one occurrence; of the type xsd:boolean) A flag to indicate whether follow-up confirmation of exercise (written or electronic) is required following telephonic notice by the buyer to the seller or seller's agent.

2.49.3 Used by:

- Complex type: Swaption

2.50 FloatingRate

2.50.1 Description:

A type defining a floating rate.

2.50.2 Contents:

floatingRateIndex (exactly one occurrence; of the type FloatingRateIndex)

indexTenor (zero or one occurrence; of the type Interval) The ISDA Designated Maturity, i.e. the tenor of the floating rate.

floatingRateMultiplierSchedule (zero or one occurrence; of the type Schedule) A rate multiplier or multiplier schedule to apply to the floating rate. A multiplier schedule is expressed as explicit multipliers and dates. In the case of a schedule, the step dates may be subject to adjustment in accordance with any adjustments specified in the calculationPeriodDatesAdjustments. The multiplier can be a positive or negative decimal. This element should only be included if the multiplier is not equal to 1 (one) for the term of the stream.

spreadSchedule (zero or more occurrences; of the type SpreadSchedule) The ISDA Spread or a Spread schedule expressed as explicit spreads and dates. In the case of a schedule, the step dates may be subject to adjustment in accordance with any adjustments specified in calculationPeriodDatesAdjustments. The spread is a per annum rate, expressed as a decimal. For purposes of determining a calculation period amount, if positive the spread will be added to the floating rate and if negative the spread will be subtracted from the floating rate. A positive 10 basis point (0.1%) spread would be represented as 0.001.

rateTreatment (zero or one occurrence; of the type RateTreatmentEnum) The specification of any rate conversion which needs to be applied to the observed rate before being used in any calculations. The two common conversions are for securities quoted on a bank discount basis which will need to be converted to either a Money Market Yield or Bond Equivalent Yield. See the Annex to the 2000 ISDA Definitions, Section 7.3. Certain General Definitions Relating to Floating Rate Options, paragraphs (g) and (h) for definitions of these terms.

capRateSchedule (zero or more occurrences; of the type StrikeSchedule) The cap rate or cap rate schedule, if any, which applies to the floating rate. The cap rate (strike) is only required where the floating rate on a swap stream is capped at a certain level. A cap rate schedule is expressed as explicit cap rates and dates and the step dates may be subject to adjustment in accordance with any adjustments specified in calculationPeriodDatesAdjustments. The cap rate is assumed to be exclusive of any spread and is a per annum rate, expressed as a decimal. A cap rate of 5% would be represented as 0.05.

floorRateSchedule (zero or more occurrences; of the type StrikeSchedule) The floor rate or floor rate schedule, if any, which applies to the floating rate. The floor rate (strike) is only required where the floating rate on a swap stream is floored at a certain strike level. A floor rate schedule is expressed as explicit floor rates and dates and the step dates may be subject to adjustment in accordance with any adjustments specified in calculationPeriodDatesAdjustments. The floor rate is assumed to be exclusive of any spread and is a per annum rate, expressed as a decimal. A floor rate of 5% would be represented as 0.05.

2.51 FloatingRateCalculation

2.51.1 Description:

A type defining the floating rate and definitions relating to the calculation of floating rate amounts.

2.51.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type FloatingRate)

- A type defining a floating rate.

initialRate (zero or one occurrence; of the type xsd:decimal) The initial floating rate reset agreed between the principal parties involved in the trade. This is assumed to be the first required reset rate for the first regular calculation period. It should only be included when the rate is not equal to the rate published on the source implied by the floating rate index. An initial rate of 5% would be represented as 0.05.

finalRateRounding (zero or one occurrence; of the type Rounding) The rounding convention to apply to the final rate used in determination of a calculation period amount.

averagingMethod (zero or one occurrence; of the type AveragingMethodEnum) If averaging is applicable, this component specifies whether a weighted or unweighted average method of calculation is to be used. The component must only be included when averaging applies.

negativeInterestRateTreatment (zero or one occurrence; of the type NegativeInterestRateTreatmentEnum) The specification of any provisions for calculating payment obligations when a floating rate is negative (either due to a quoted negative floating rate or by operation of a spread that is subtracted from the floating rate).

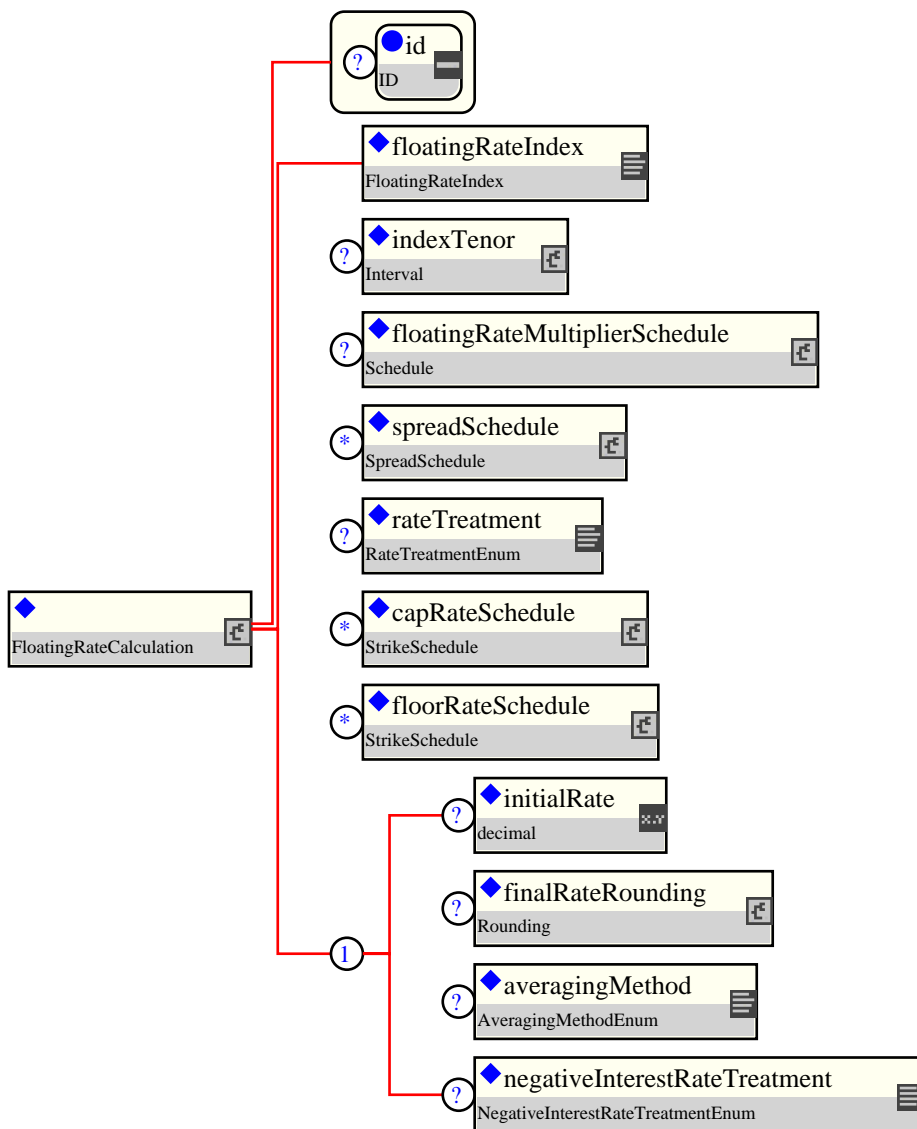

2.51.3 Used by:

- Element: floatingRateCalculation
- Element: rateCalculation

2.56 FxCashSettlement

2.56.1 Description:

A type that is used for describing cash settlement of an option / non deliverable forward. It includes the currency to settle into together with the fixings required to calculate the currency amount.

2.56.2 Contents:

settlementCurrency (exactly one occurrence; of the type Currency) The currency in which a cash settlement for non-deliverable forward and non-deliverable options.

fixing (one or more occurrences; of the type FxFixing) Specifies the source for and timing of a fixing of an exchange rate. This is used in the agreement of non-deliverable forward trades as well as various types of FX OTC options that require observations against a particular rate.

2.56.3 Used by:

- Complex type: FxLeg
- Complex type: FxOptionLeg
- Complex type: QuotableFxLeg

2.56.4 Derived Types:

2.56.5 Figure:

2.57 FxFixing

2.57.1 Description:

A type that specifies the source for and timing of a fixing of an exchange rate. This is used in the agreement of non-deliverable forward trades as well as various types of FX OTC options that require observations against a particular rate.

2.57.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type FxSpotRateSource)

- A type defining the source and time for an fx rate.

quotedCurrencyPair (exactly one occurrence; of the type QuotedCurrencyPair) Defines the two currencies for an FX trade and the quotation relationship between the two currencies.

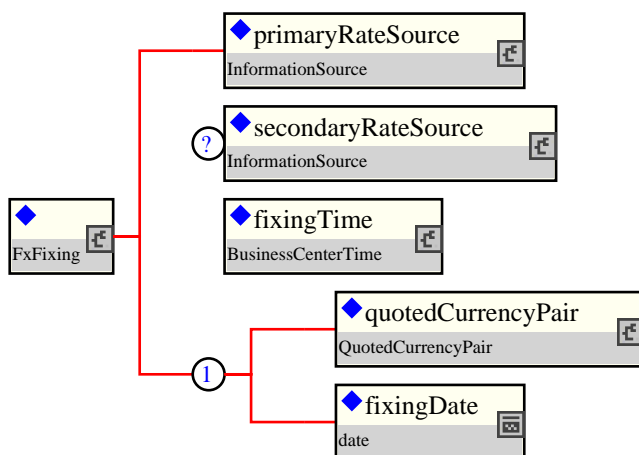

fixingDate (exactly one occurrence; of the type xsd:date) Describes the specific date when a non-deliverable forward or non-deliverable option will "fix" against a particular rate, which will be used to compute the ultimate cash settlement.

2.57.3 Used by:

- Complex type: FxCashSettlement

2.57.4 Derived Types:

2.58 FxRate

2.58.1 Description:

A type describing the rate of a currency conversion: pair of currency, quotation mode and exchange rate.

2.58.2 Contents:

quotedCurrencyPair (exactly one occurrence; of the type QuotedCurrencyPair) Defines the two currencies for an FX trade and the quotation relationship between the two currencies.

rate (exactly one occurrence; of the type xsd:decimal) The rate of exchange between the two currencies of the leg of a deal. Must be specified with a quote basis.

2.58.3 Used by:

- Complex type: ExchangeRate
- Complex type: AssetValuation
- Complex type: Commission
- Complex type: FxConversion
- Complex type: Quanto

```

2.59 FxSpotRateSource

2.59.1 Description:

A type defining the source and time for an fx rate.

2.59.2 Contents:

primaryRateSource (exactly one occurrence; of the type InformationSource) The primary source for where the rate observation will occur. Will typically be either a page or a reference bank published rate.

secondaryRateSource (zero or one occurrence; of the type InformationSource) An alternative, or secondary, source for where the rate observation will occur. Will typically be either a page or a reference bank published rate.

fixingTime (exactly one occurrence; of the type BusinessCenterTime) The time at which the spot currency exchange rate will be observed. It is specified as a time in a specific business center, e.g. 11:00am London time.

2.59.3 Used by:

- Complex type: FxFixing
- Complex type: Composite
- Complex type: FxLinkedNotionalSchedule
- Complex type: FxRateAsset
- Complex type: Quanto

  </xsd:complexType>
```

2.65 InformationSource

2.65.1 Description:

A type defining the source for a piece of information (e.g. a rate refix or an fx fixing).

2.65.2 Contents:

rateSource (exactly one occurrence; of the type InformationProvider) An information source for obtaining a market rate. For example Bloomberg, Reuters, Telerate etc.

rateSourcePage (zero or one occurrence; of the type RateSourcePage) A specific page for the rate source for obtaining a market rate.

rateSourcePageHeading (zero or one occurrence; of the type xsd:string) The heading for the rate source on a given rate source page.

2.65.3 Used by:

- Complex type: FxAmericanTrigger
- Complex type: FxAverageRateOption
- Complex type: FxBarrier
- Complex type: FxEuropeanTrigger
- Complex type: FxSpotRateSource
- Complex type: SettlementRateSource

2.65.4 Derived Types:

2.67 InterestAccrualsCompoundingMethod

2.67.1 Description:

A type defining the way in which interests are accrued: the applicable rate (fixed or floating reference) and the compounding method.

2.67.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type InterestAccrualsMethod)

- A type describing the method for accruing interests on dividends. Can be either a fixed rate reference or a floating rate reference.

compoundingMethod (exactly one occurrence; of the type CompoundingMethodEnum) If more that one calculation period contributes to a single payment amount this element specifies whether compounding is applicable, and if so, what compounding method is to be used. This element must only be included when more that one calculation period contributes to a single payment amount.

2.67.3 Used by:

- Complex type: DividendConditions

2.67.4 Derived Types:

2.67.5 Figure:

2.67.6 Schema Fragment:

```
</xsd:complexContent>  
</xsd:complexType>
```

2.68 InterestAccrualsMethod

2.68.1 Description:

A type describing the method for accruing interests on dividends. Can be either a fixed rate reference or a floating rate reference.

2.68.2 Contents:

Either

floatingRateCalculation (exactly one occurrence; of the type FloatingRateCalculation) The floating rate calculation definitions

Or

fixedRate (exactly one occurrence; of the type xsd:decimal) The calculation period fixed rate. A per annum rate, expressed as a decimal. A fixed rate of 5% would be represented as 0.05.

2.68.3 Used by:

- Complex type: InterestAccrualsCompoundingMethod
- Complex type: InterestCalculation
- Complex type: CompoundingRate

2.68.4 Derived Types:

- Complex type: InterestAccrualsCompoundingMethod
- Complex type: InterestCalculation

```

2.69 IntermediaryInformation

2.69.1 Description:

A type that describes the information to identify an intermediary through which payment will be made by the correspondent bank to the ultimate beneficiary of the funds.

2.69.2 Contents:

Either

routingIds (exactly one occurrence; of the type RoutingIds) A set of unique identifiers for a party, each one identifying the party within a payment system. The assumption is that each party will not have more than one identifier within the same payment system.

Or

routingExplicitDetails (exactly one occurrence; of the type RoutingExplicitDetails) A set of details that is used to identify a party involved in the routing of a payment when the party does not have a code that identifies it within one of the recognized payment systems.

Or

routingIdsAndExplicitDetails (exactly one occurrence; of the type RoutingIdsAndExplicitDetails) A combination of coded payment system identifiers and details for physical addressing for a party involved in the routing of a payment.

intermediarySequenceNumber (exactly one occurrence; of the type xsd:integer) A sequence number that gives the position of the current intermediary in the chain of payment intermediaries. The assumed domain value set is an ascending sequence of integers starting from 1.

2.69.3 Used by:

2.70 Interval

2.70.1 Description:

A type defining a time interval or offset, e.g. one day, three months. Used for specifying frequencies at which events occur, the tenor of a floating rate or an offset relative to another date.

2.70.2 Contents:

periodMultiplier (exactly one occurrence; of the type xsd:integer) A time period multiplier, e.g. 1, 2 or 3 etc. A negative value can be used when specifying an offset relative to another date, e.g. -2 days. If the period value is T (Term) then periodMultiplier must contain the value 1.

period (exactly one occurrence; of the type PeriodEnum) A time period, e.g. a day, week, month, year or term of the stream. If the periodMultiplier value is 0 (zero) then period must contain the value D (day).

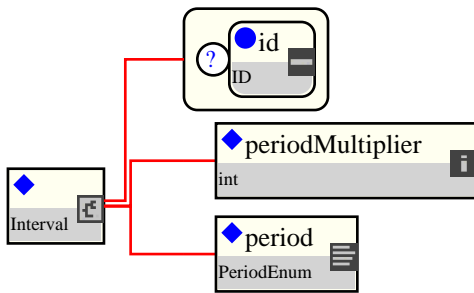

2.70.3 Used by:

- Complex type: CalculationPeriodFrequency
- Complex type: Offset
- Complex type: ResetFrequency
- Complex type: Bond
- Complex type: DeliverableObligations
- Complex type: Deposit
- Complex type: EarlyTerminationProvision
- Complex type: ExercisePeriod
- Complex type: FloatingRate
- Complex type: ForecastRateIndex
- Complex type: Fra
- Complex type: NotionalStepRule
- Complex type: PaymentDates
- Complex type: PeriodicPayment
- Complex type: QuotedAs
- Complex type: RateIndex
- Complex type: ReturnSwapLeg
- Complex type: ScheduledTerminationDate
- Complex type: SimpleCreditDefaultSwap
- Complex type: SimpleFra
- Complex type: SimpleIRSwap
- Complex type: TimeDimension

2.70.4 Derived Types:

- Complex type: CalculationPeriodFrequency
- Complex type: Offset
- Complex type: ResetFrequency

2.72 ManualExercise

2.72.1 Description:

A type defining manual exercise, i.e. that the option buyer counterparty must give notice to the option seller of exercise.

2.72.2 Contents:

exerciseNotice (zero or one occurrence; of the type ExerciseNotice) Definition of the party to whom notice of exercise should be given.

fallbackExercise (zero or one occurrence; of the type xsd:boolean) If fallback exercise is specified then the notional amount of the underlying swap, not previously exercised under the swaption, will be automatically exercised at the expiration time on the expiration date if at such time the buyer is in-the-money, provided that the difference between the settlement rate and the fixed rate under the relevant underlying swap is not less than one tenth of a percentage point (0.10% or 0.001). The term in-the-money is assumed to have the meaning defined in the 2000 ISDA Definitions, Section 17.4. In-the-money.

2.81 MultipleExercise

2.81.1 Description:

A type defining multiple exercise. As defined in the 200 ISDA Definitions, Section 12.4. Multiple Exercise, the buyer of the option has the right to exercise all or less than all the unexercised notional amount of the underlying swap on one or more days in the exercise period, but on any such day may not exercise less than the minimum notional amount or more than the maximum notional amount, and if an integral multiple amount is specified, the notional exercised must be equal to or, be an integral multiple of, the integral multiple amount.

2.81.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type PartialExercise)

- A type defining partial exercise. As defined in the 2000 ISDA Definitions, Section 12.3 Partial Exercise, the buyer of the option may exercise all or less than all the notional amount of the underlying swap but may not be less than the minimum notional amount (if specified) and must be an integral multiple of the integral multiple amount if specified.

maximumNotionalAmount (zero or one occurrence; of the type xsd:decimal) The maximum notional amount that can be exercised on a given exercise date.

2.81.3 Used by:

- Complex type: AmericanExercise
- Complex type: BermudaExercise

2.81.4 Derived Types:

2.82 Offset

2.82.1 Description:

A type defining an offset used in calculating a new date relative to a reference date. Currently, the only offsets defined are expected to be expressed as either calendar or business day offsets.

2.82.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Interval)

- A type defining a time interval or offset, e.g. one day, three months. Used for specifying frequencies at which events occur, the tenor of a floating rate or an offset relative to another date.

dayType (zero or one occurrence; of the type DayTypeEnum) In the case of an offset specified as a number of days, this element defines whether consideration is given as to whether a day is a good business day or not. If a day type of business days is specified then non-business days are ignored when calculating the offset. The financial business centers to use for determination of business days are implied by the context in which this element is used. This element must only be included when the offset is specified as a number of days. If the offset is zero days then the dayType element should not be included.

2.82.3 Used by:

- Complex type: DateOffset
- Complex type: FxFixingDate
- Complex type: RelativeDateOffset
- Complex type: GracePeriodExtension
- Complex type: InflationRateCalculation
- Complex type: PaymentDates
- Complex type: ResetDates

2.82.4 Derived Types:

2.83 PartialExercise

2.83.1 Description:

A type defining partial exercise. As defined in the 2000 ISDA Definitions, Section 12.3 Partial Exercise, the buyer of the option may exercise all or less than all the notional amount of the underlying swap but may not be less than the minimum notional amount (if specified) and must be an integral multiple of the integral multiple amount if specified.

2.83.2 Contents:

notionalReference (one or more occurrences; of the type Reference) A pointer style reference to the associated notional schedule defined elsewhere in the document.

integralMultipleAmount (zero or one occurrence; of the type xsd:decimal) A notional amount which restricts the amount of notional that can be exercised when partial exercise or multiple exercise is applicable. The integral multiple amount defines a lower limit of notional that can be exercised and also defines a unit multiple of notional that can be exercised, i.e. only integer multiples of this amount can be exercised.

minimumNotionalAmount (exactly one occurrence; of the type xsd:decimal) The minimum notional amount that can be exercised on a given exercise date. See multipleExercise.

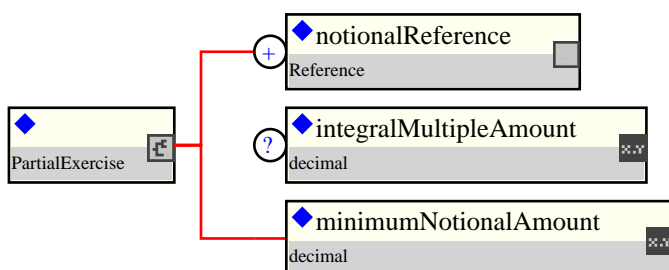

2.83.3 Used by:

- Complex type: MultipleExercise
- Complex type: EuropeanExercise

2.83.4 Derived Types:

- Complex type: MultipleExercise

2.84 Payment

2.84.1 Description:

A type for defining payments

2.84.2 Contents:

payerPartyReference (exactly one occurrence; of the type Reference) A reference to the party responsible for making the payments defined by this structure.

receiverPartyReference (exactly one occurrence; of the type Reference) A reference to the party that receives the payments corresponding to this structure.

paymentAmount (exactly one occurrence; of the type Money) The currency amount of the payment.

paymentDate (zero or one occurrence; of the type AdjustableDate) The payment date. This date is subject to adjustment in accordance with any applicable business day convention.

adjustedPaymentDate (zero or one occurrence; of the type IdentifiedDate) The adjusted payment date. This date should already be adjusted for any applicable business day convention. This component is not intended for use in trade confirmation but may be specified to allow the fee structure to also serve as a cashflow type component (all dates the the Cashflows type are adjusted payment dates).

paymentType (zero or one occurrence; of the type PaymentType) A classification of the type of fee or additional payment, e.g. brokerage, upfront fee etc. FpML does not define domain values for this element.

settlementInformation (zero or one occurrence; of the type SettlementInformation) The information required to settle a currency payment that results from a trade.

discountFactor (zero or one occurrence; of the type xsd:decimal) The value representing the discount factor used to calculate the present value of the cash flow.

presentValueAmount (zero or one occurrence; of the type Money) The amount representing the present value of the forecast payment.

2.88 PrincipalExchanges

2.88.1 Description:

A type defining which principal exchanges occur for the stream.

2.88.2 Contents:

initialExchange (exactly one occurrence; of the type xsd:boolean) A true/false flag to indicate whether there is an initial exchange of principal on the effective date.

finalExchange (exactly one occurrence; of the type xsd:boolean) A true/false flag to indicate whether there is a final exchange of principal on the termination date.

intermediateExchange (exactly one occurrence; of the type xsd:boolean) A true/false flag to indicate whether there are intermediate or interim exchanges of principal during the term of the swap.

2.92 QuotedCurrencyPair

2.92.1 Description:

A type that describes the composition of a rate that has been quoted or is to be quoted. This includes the two currencies and the quotation relationship between the two currencies and is used as a building block throughout the FX specification.

2.92.2 Contents:

currency1 (exactly one occurrence; of the type Currency) The first currency specified when a pair of currencies is to be evaluated.

currency2 (exactly one occurrence; of the type Currency) The second currency specified when a pair of currencies is to be evaluated.

quoteBasis (exactly one occurrence; of the type QuoteBasisEnum) The method by which the exchange rate is quoted.

2.92.3 Used by:

- Complex type: FxAmericanTrigger
- Complex type: FxBarrier
- Complex type: FxDigitalOption
- Complex type: FxEuropeanTrigger
- Complex type: FxFixing

2.93 RateObservation

2.93.1 Description:

A type defining parameters associated with an individual observation or fixing. This type forms part of the cashflow representation of a stream.

2.93.2 Contents:

resetDate (zero or one occurrence; of the type xsd:date) The reset date.

adjustedFixingDate (zero or one occurrence; of the type xsd:date) The adjusted fixing date, i.e. the actual date the rate is observed. The date should already be adjusted for any applicable business day convention.

observedRate (zero or one occurrence; of the type xsd:decimal) The actual observed rate before any required rate treatment is applied, e.g. before converting a rate quoted on a discount basis to an equivalent yield. An observed rate of 5% would be represented as 0.05.

treatedRate (zero or one occurrence; of the type xsd:decimal) The observed rate after any required rate treatment is applied. A treated rate of 5% would be represented as 0.05.

observationWeight (exactly one occurrence; of the type xsd:positiveInteger) The number of days weighting to be associated with the rate observation, i.e. the number of days such rate is in effect. This is applicable in the case of a weighted average method of calculation where more than one reset date is established for a single calculation period.

rateReference (zero or one occurrence; of the type Reference) A pointer style reference to a floating rate component defined as part of a stub calculation period amount component. It is only required when it is necessary to distinguish two rate observations for the same fixing date which could occur when linear interpolation of two different rates occurs for a stub calculation period.

forecastRate (zero or one occurrence; of the type xsd:decimal) The value representing the forecast rate used to calculate the forecast future value of the accrual period. A value of 1% should be represented as 0.01

treatedForecastRate (zero or one occurrence; of the type xsd:decimal) The value representing the forecast rate after applying rate treatment rules. A value of 1% should be represented as 0.01

2.93.3 Used by:

```

2.99 RelativeDateOffset

2.99.1 Description:

A type defining a date (referred to as the derived date) as a relative offset from another date (referred to as the anchor date). If the anchor date is itself an adjustable date then the offset is assumed to be calculated from the adjusted anchor date. A number of different scenarios can be supported, namely; 1) the derived date may simply be a number of calendar periods (days, weeks, months or years) preceding or following the anchor date; 2) the unadjusted derived date may be a number of calendar periods (days, weeks, months or years) preceding or following the anchor date with the resulting unadjusted derived date subject to adjustment in accordance with a specified business day convention, i.e. the derived date must fall on a good business day; 3) the derived date may be a number of business days preceding or following the anchor date. Note that the businessDayConvention specifies any required adjustment to the unadjusted derived date. A negative or positive value in the periodMultiplier indicates whether the unadjusted derived precedes or follows the anchor date. The businessDayConvention should contain a value NONE if the day type element contains a value of Business (since specifying a negative or positive business days offset would already guarantee that the derived date would fall on a good business day in the specified business centers).

2.99.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Offset)

- A type defining an offset used in calculating a new date relative to a reference date. Currently, the only offsets defined are expected to be expressed as either calendar or business day offsets.

businessDayConvention (exactly one occurrence; of the type BusinessDayConventionEnum) The convention for adjusting a date if it would otherwise fall on a day that is not a business day.

Either

businessCentersReference (exactly one occurrence; of the type Reference) A pointer style reference to a set of financial business centers defined elsewhere in the document. This set of business centers is used to determine whether a particular day is a business day or not.

Or

businessCenters (exactly one occurrence; of the type BusinessCenters)

dateRelativeTo (exactly one occurrence; of the type Reference) Specifies the anchor as an href attribute. The href attribute value is a pointer style reference to the element or component elsewhere in the document where the anchor date is defined.

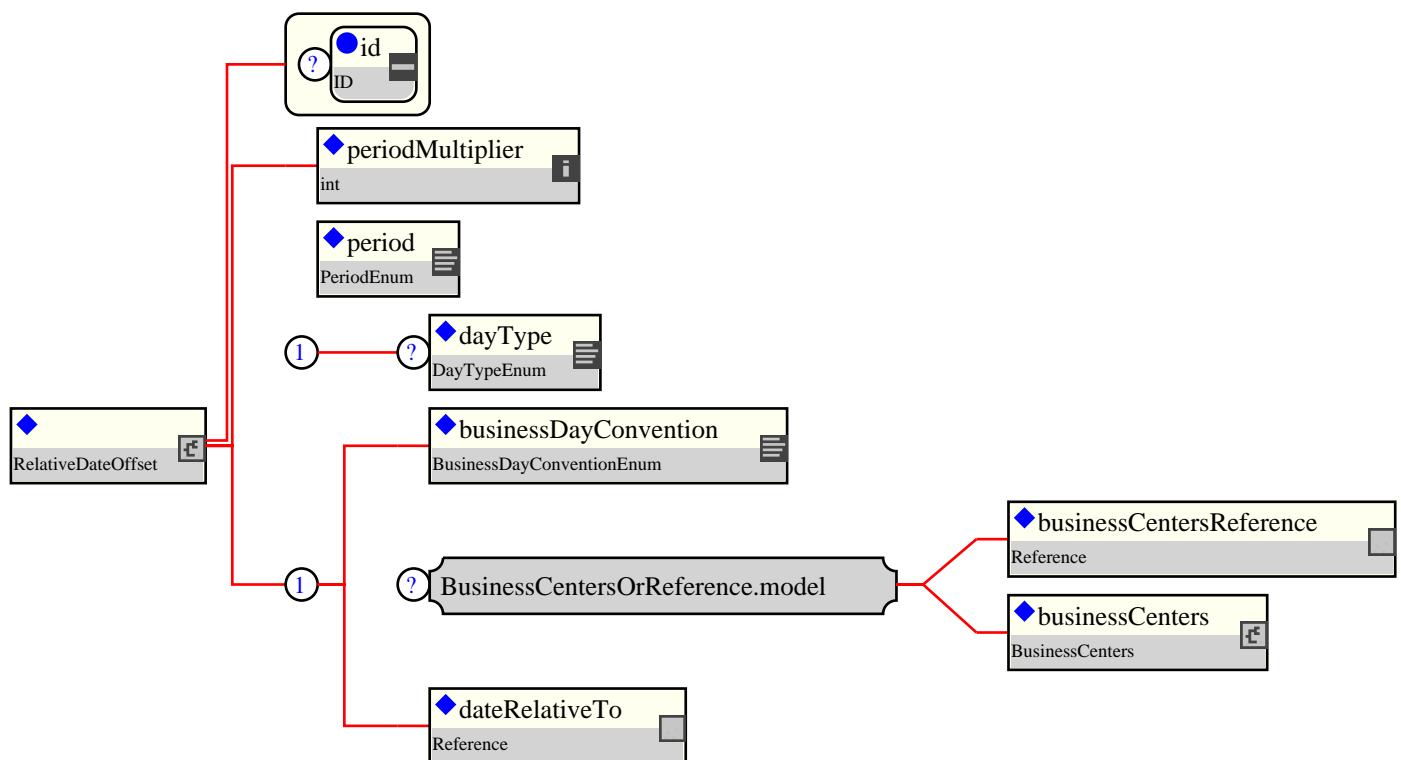

2.99.3 Used by:

2.100 RelativeDates

2.100.1 Description:

A type describing a set of dates defined as relative to another set of dates.

2.100.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type `RelativeDateOffset`)

- A type defining a date (referred to as the derived date) as a relative offset from another date (referred to as the anchor date). If the anchor date is itself an adjustable date then the offset is assumed to be calculated from the adjusted anchor date. A number of different scenarios can be supported, namely; 1) the derived date may simply be a number of calendar periods (days, weeks, months or years) preceding or following the anchor date; 2) the unadjusted derived date may be a number of calendar periods (days, weeks, months or years) preceding or following the anchor date with the resulting unadjusted derived date subject to adjustment in accordance with a specified business day convention, i.e. the derived date must fall on a good business day; 3) the derived date may be a number of business days preceding or following the anchor date. Note that the `businessDayConvention` specifies any required adjustment to the unadjusted derived date. A negative or positive value in the `periodMultiplier` indicates whether the unadjusted derived precedes or follows the anchor date. The `businessDayConvention` should contain a value `NONE` if the day type element contains a value of `Business` (since specifying a negative or positive business days offset would already guarantee that the derived date would fall on a good business day in the specified business centers).

periodSkip (zero or one occurrence; of the type `xsd:positiveInteger`) The number of periods in the referenced date schedule that are between each date in the relative date schedule. Thus a skip of 2 would mean that dates are relative to every second date in the referenced schedule. If present this should have a value greater than 1.

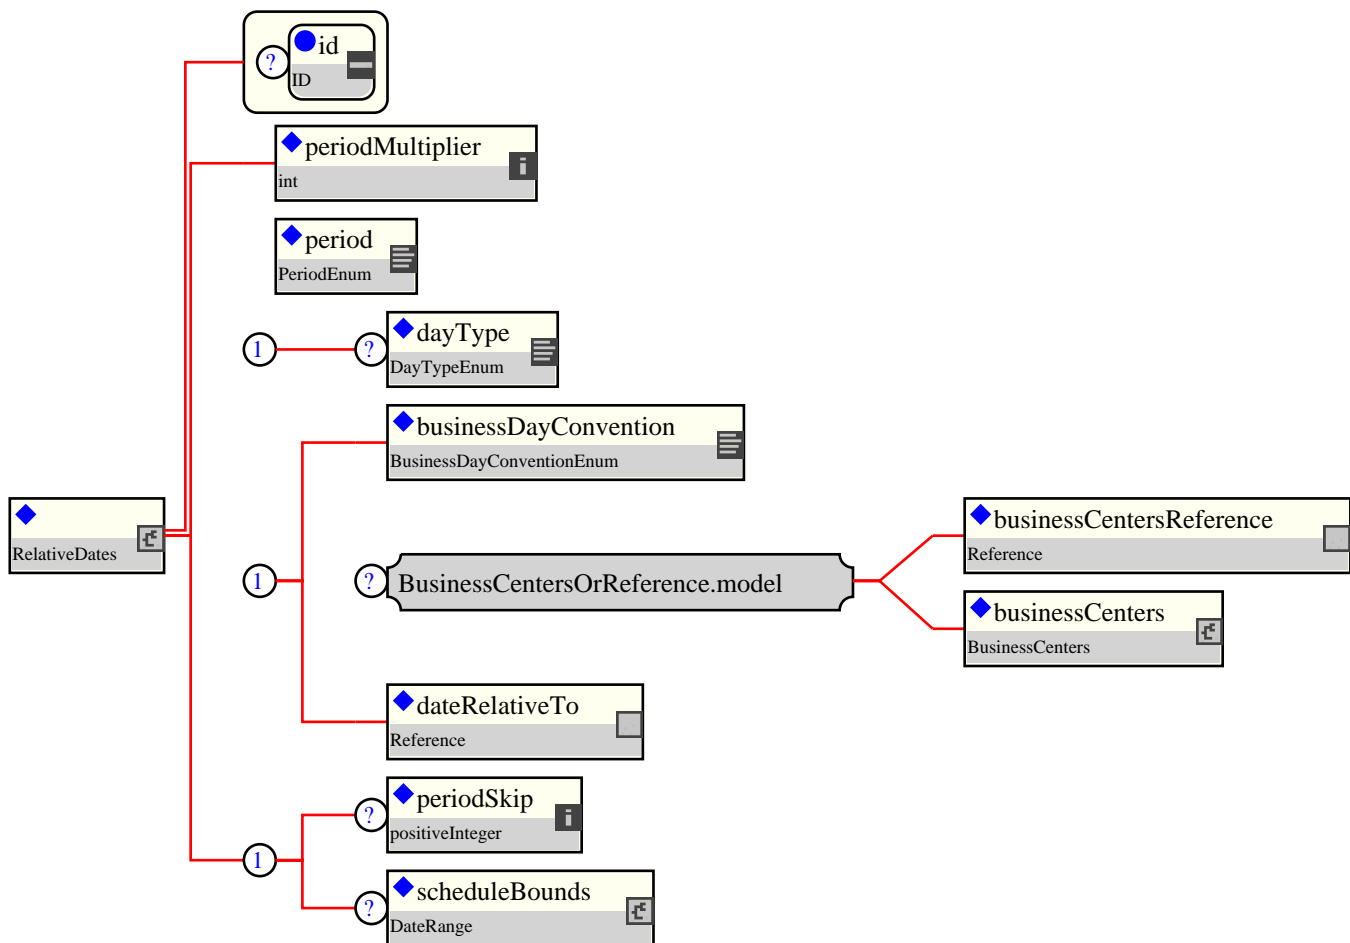

scheduleBounds (zero or one occurrence; of the type `DateRange`) The first and last dates of a schedule. This can be used to restrict the range of values in a reference series of dates.

2.100.3 Used by:

- Complex type: `AdjustableOrRelativeDates`

2.105 Routing

2.105.1 Description:

A type that provides three alternative ways of identifying a party involved in the routing of a payment. The identification may use payment system identifiers only; actual name, address and other reference information; or a combination of both.

2.105.2 Contents:

Either

routingIds (exactly one occurrence; of the type RoutingIds) A set of unique identifiers for a party, eachone identifying the party within a payment system. The assumption is that each party will not have more than one identifier within the same payment system.

Or

routingExplicitDetails (exactly one occurrence; of the type RoutingExplicitDetails) A set of details that is used to identify a party involved in the routing of a payment when the party does not have a code that identifies it within one of the recognized payment systems.

Or

routingIdsAndExplicitDetails (exactly one occurrence; of the type RoutingIdsAndExplicitDetails) A combination of coded payment system identifiers and details for physical addressing for a party involved in the routing of a payment.

2.105.3 Used by:

- Complex type: SettlementInstruction
- Complex type: SplitSettlement

2.105.4 Derived Types:

2.109 RoutingIdsAndExplicitDetails

2.109.1 Description:

A type that provides a combination of payment system identification codes with physical postal address details, for the purposes of identifying a party involved in the routing of a payment.

2.109.2 Contents:

routingIds (one or more occurrences; of the type RoutingIds) A set of unique identifiers for a party, each one identifying the party within a payment system. The assumption is that each party will not have more than one identifier within the same payment system.

routingName (exactly one occurrence; of the type xsd:string) A real name that is used to identify a party involved in the routing of a payment.

routingAddress (zero or one occurrence; of the type Address) A physical postal address via which a payment can be routed.

routingAccountNumber (zero or one occurrence; of the type xsd:string) An account number via which a payment can be routed.

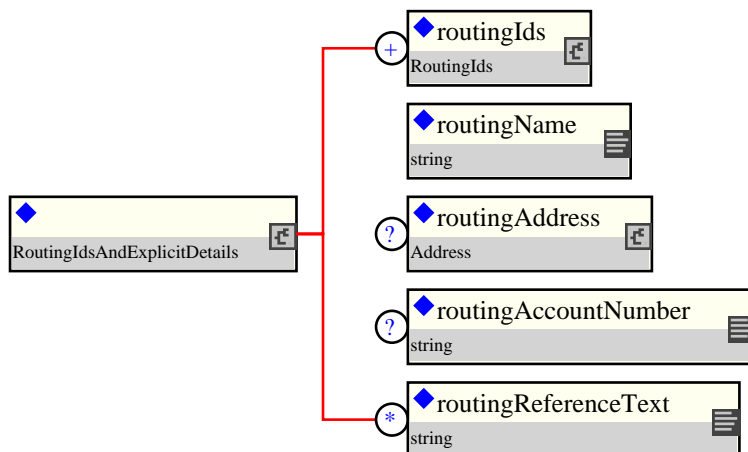

routingReferenceText (zero or more occurrences; of the type xsd:string) A piece of free-format text used to assist the identification of a party involved in the routing of a payment.

2.109.3 Used by:

- Complex type: IntermediaryInformation
- Complex type: Routing

2.110 Schedule

2.110.1 Description:

A type defining a schedule of rates or amounts in terms of an initial value and then a series of step date and value pairs. On each step date the rate or amount changes to the new step value. The series of step date and value pairs are optional. If not specified, this implies that the initial value remains unchanged over time.

2.110.2 Contents:

initialValue (exactly one occurrence; of the type xsd:decimal) The initial rate or amount, as the case may be. An initial rate of 5% would be represented as 0.05.

step (zero or more occurrences; of the type Step) The schedule of step date and value pairs. On each step date the associated step value becomes effective. A list of steps may be ordered in the document by ascending step date. An FpML document containing an unordered list of steps is still regarded as a conformant document.

2.110.3 Used by:

- Complex type: AmountSchedule
- Complex type: SpreadSchedule
- Complex type: StrikeSchedule
- Complex type: Calculation
- Complex type: ExerciseFeeSchedule
- Complex type: FloatingRate
- Complex type: TradeUnderlyer

2.111 SettlementInformation

2.111.1 Description:

A type that represents the choice of methods for settling a potential currency payment resulting from a trade: by means of a standard settlement instruction, by netting it out with other payments, or with an explicit settlement instruction.

2.111.2 Contents:

Either

standardSettlementStyle (exactly one occurrence; of the type StandardSettlementStyleEnum) An optional element used to describe how a trade will settle. This defines a scheme and is used for identifying trades that are identified as settling standard and/or flagged for settlement netting.

Or

settlementInstruction (exactly one occurrence; of the type SettlementInstruction) An explicit specification of how a currency payment is to be made, when the payment is not netted and the route is other than the recipient's standard settlement instruction.

2.111.3 Used by:

- Complex type: FxOptionPayout
- Complex type: FxOptionPremium
- Complex type: Payment

2.111.4 Derived Types:

```

2.112 SettlementInstruction

2.112.1 Description:

A type that models a complete instruction for settling a currency payment, including the settlement method to be used, the correspondent bank, any intermediary banks and the ultimate beneficiary.

2.112.2 Contents:

settlementMethod (zero or one occurrence; of the type SettlementMethod) The mechanism by which settlement is to be made. The scheme of domain values will include standard mechanisms such as CLS, Fedwire, Chips ABA, Chips UID, SWIFT, CHAPS and DDA.

correspondentInformation (zero or one occurrence; of the type Routing) The information required to identify the correspondent bank that will make delivery of the funds on the paying bank's behalf in the country where the payment is to be made

intermediaryInformation (zero or more occurrences; of the type IntermediaryInformation) Information to identify an intermediary through which payment will be made by the correspondent bank to the ultimate beneficiary of the funds.

beneficiaryBank (zero or one occurrence; of the type Routing) The bank that acts for the ultimate beneficiary of the funds in receiving payments.

beneficiary (exactly one occurrence; of the type Routing) The ultimate beneficiary of the funds. The beneficiary can be identified either by an account at the beneficiaryBank (qv) or by explicit routingInformation. This element provides for the latter.

splitSettlement (zero or more occurrences; of the type SplitSettlement) The set of individual payments that are to be made when a currency payment settling a trade needs to be split between a number of ultimate beneficiaries. Each split payment may need to have its own routing information.

2.115 SharedAmericanExercise

2.115.1 Description:

TBA

2.115.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Exercise)

- The abstract base class for all types which define way in which options may be exercised.

commencementDate (exactly one occurrence; of the type AdjustableOrRelativeDate) The first day of the exercise period for an American style option.

expirationDate (exactly one occurrence; of the type AdjustableOrRelativeDate) The last day within an exercise period for an American style option. For a European style option it is the only day within the exercise period.

latestExerciseTime (zero or one occurrence; of the type BusinessCenterTime) For a Bermuda or American style option, the latest time on an exercise business day (excluding the expiration date) within the exercise period that notice can be given by the buyer to the seller or seller's agent. Notice of exercise given after this time will be deemed to have been given on the next exercise business day.

```

2.118 SpreadScheduleType

2.118.1 Description:

Defines a Spread Type Scheme to identify a long or short spread value.

2.118.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type `xsd:normalizedString`)

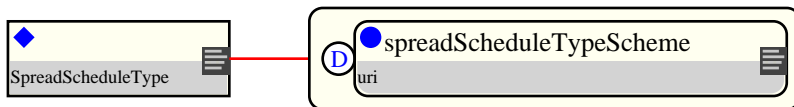

•

2.118.3 Used by:

- Complex type: SpreadSchedule

2.118.4 Derived Types:

2.118.5 Figure:

2.118.6 Schema Fragment:

```
<xsd:complexType name="SpreadScheduleType">
  <xsd:annotation>
    <xsd:documentation xml:lang="en">

    </xsd:extension>
  </xsd:simpleContent>
</xsd:complexType>
```

2.119 Step

2.119.1 Description:

A type defining a step date and step value pair. This step definitions are used to define varying rate or amount schedules, e.g. a notional amortization or a step-up coupon schedule.

2.119.2 Contents:

stepDate (exactly one occurrence; of the type `xsd:date`) The date on which the associated `stepValue` becomes effective. This day may be subject to adjustment in accordance with a business day convention.

stepValue (exactly one occurrence; of the type `xsd:decimal`) The rate or amount which becomes effective on the associated `stepDate`. A rate of 5% would be represented as 0.05.

2.119.3 Used by:

- Complex type: Schedule

2.119.4 Derived Types:

2.119.5 Figure:

  </xsd:sequence>
</xsd:complexType>
```

2.121 Strike

2.121.1 Description:

A type describing a single cap or floor rate.

2.121.2 Contents:

strikeRate (exactly one occurrence; of the type xsd:decimal) The rate for a cap or floor.

buyer (zero or one occurrence; of the type IdentifiedPayerReceiver) The buyer of the option

seller (zero or one occurrence; of the type IdentifiedPayerReceiver) The party that has sold.

2.121.3 Used by:

- Complex type: CashflowFixing
- Complex type: FloatingRateDefinition

2.121.4 Derived Types:

```

2.122 StrikeSchedule

2.122.1 Description:

A type describing a schedule of cap or floor rates.

2.122.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Schedule)

- A type defining a schedule of rates or amounts in terms of an initial value and then a series of step date and value pairs. On each step date the rate or amount changes to the new step value. The series of step date and value pairs are optional. If not specified, this implies that the initial value remains unchanged over time.

buyer (zero or one occurrence; of the type IdentifiedPayerReceiver) The buyer of the option

seller (zero or one occurrence; of the type IdentifiedPayerReceiver) The party that has sold.

2.122.3 Used by:

- Complex type: FloatingRate

<xsd:complexType name="RelativeDateOffset">
  <xsd:annotation>
    <xsd:documentation xml:lang="en">
      A type defining a date (referred to as the derived date) as a
      relative offset from another date (referred to as the anchor
      date). If the anchor date is itself an adjustable date then the
      offset is assumed to be calculated from the adjusted anchor
      date. A number of different scenarios can be supported, namely;
      1) the derived date may simply be a number of calendar periods
      (days, weeks, months or years) preceding or following the
      anchor date; 2) the unadjusted derived date may be a number of
      calendar periods(days, weeks, months or years) preceding or
      following the anchor date with the resulting unadjusted derived
      date subject to adjustment in accordance with a specified
      business day convention, i.e. the derived date must fall on a
      good business day; 3) the derived date may be a number of
      business days preceding or following the anchor date. Note that
      the businessDayConvention specifies any required adjustment to
      the unadjusted derived date. A negative or positive value in
      the periodMultiplier indicates whether the unadjusted derived
      precedes or follows the anchor date. The businessDayConvention
      should contain a value NONE if the day type element contains a
      value of Business (since specifying a negative or positive
      business days offset would already guarantee that the derived
      date would fall on a good business day in the specified
      business centers).
