1.23 PricingStructureValuation

1.23.1 Description:

An abstract pricing structure valuation base type. Used as a base for values of pricing structures such as yield curves and volatility matrices. Derived from the "Valuation" type.

1.23.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Valuation)

- A valuation of an valuable object - an asset or a pricing input. This is an abstract type, used as a base for values of pricing structures such as yield curves as well as asset values.

baseDate (exactly one occurrence; of the type IdentifiedDate) The base date for which the structure applies, i.e. the curve date. Normally this will align with the valuation date.

spotDate (zero or one occurrence; of the type IdentifiedDate) The spot settlement date for which the structure applies, normally 0-2 days after the base date. The difference between the baseDate and the spotDate is termed the settlement lag, and is sometimes called "days to spot".

inputDataDate (zero or one occurrence; of the type IdentifiedDate) The date from which the input data used to construct the pricing input was obtained. Often the same as the baseDate, but sometimes the pricing input may be "rolled forward", in which input data from one date is used to generate a curve for a later date.

endDate (zero or one occurrence; of the type IdentifiedDate) The last date for which data is supplied in this pricing input.

buildDateTime (zero or one occurrence; of the type xsd:dateTime) The date and time when the pricing input was generated.
